

Fenceline-Hunt

User Guide

GPS trip recording over property boundaries
Cull logging and drop pins
Statistics and collated cull maps
Offline basemaps that work with no signal

App version 1.3.46 · October 2026
Everything in this guide was shot on real screens using demo data.
Your trips, properties and settings never leave your device.

Part A — Getting started

Installing the app, granting permissions, activating your licence and recording your first trip.

CHAPTER 1

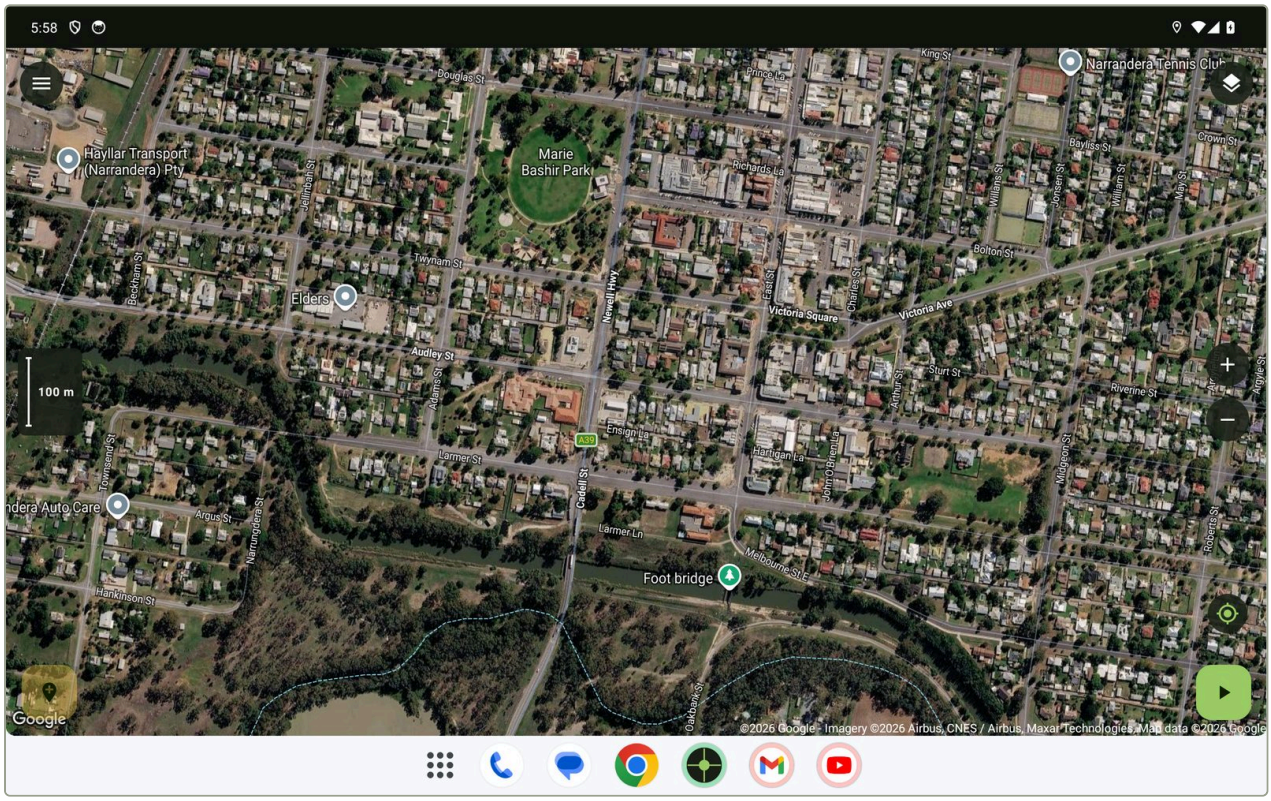

Welcome — what Fenceline-Hunt does

GPS trip recording over property boundaries, cull logging, statistics and offline basemaps — all on your device, with nothing leaving it.

Fenceline-Hunt turns your phone or tablet into a field companion for boundary work. At its core it does three things:

1. **Records where you travel** — walk or drive the boundary with the GPS track running, and the app saves the route as a trip.
2. **Marks what you find** — drop pins for gates, fence damage or animal culls while you record.
3. **Summarises your work** — the Statistics hub totals your trips and culls by species and property.

> **Works offline.** Everything is stored on the device. Maps you save for offline use keep working with no phone signal.

The map screen. Speed, altitude and heading read along the bottom; the menu, recenter and zoom controls stay at the edges.

CHAPTER 2

Installing the app

Fenceline-Hunt is not sold through the Play Store — you install it directly from the APK file.

The easiest way to update is from inside the app itself — it checks for a newer version on launch and offers it on a banner. Tap the banner, or open **Menu** ▸ **Settings** ▸ **Software Update** ▸ **Check for Updates**, then:

1. Tap **Download** and wait — a progress percentage runs while the update downloads.
2. When it is ready, tap **Install Now**. Android hands you the standard install screen.

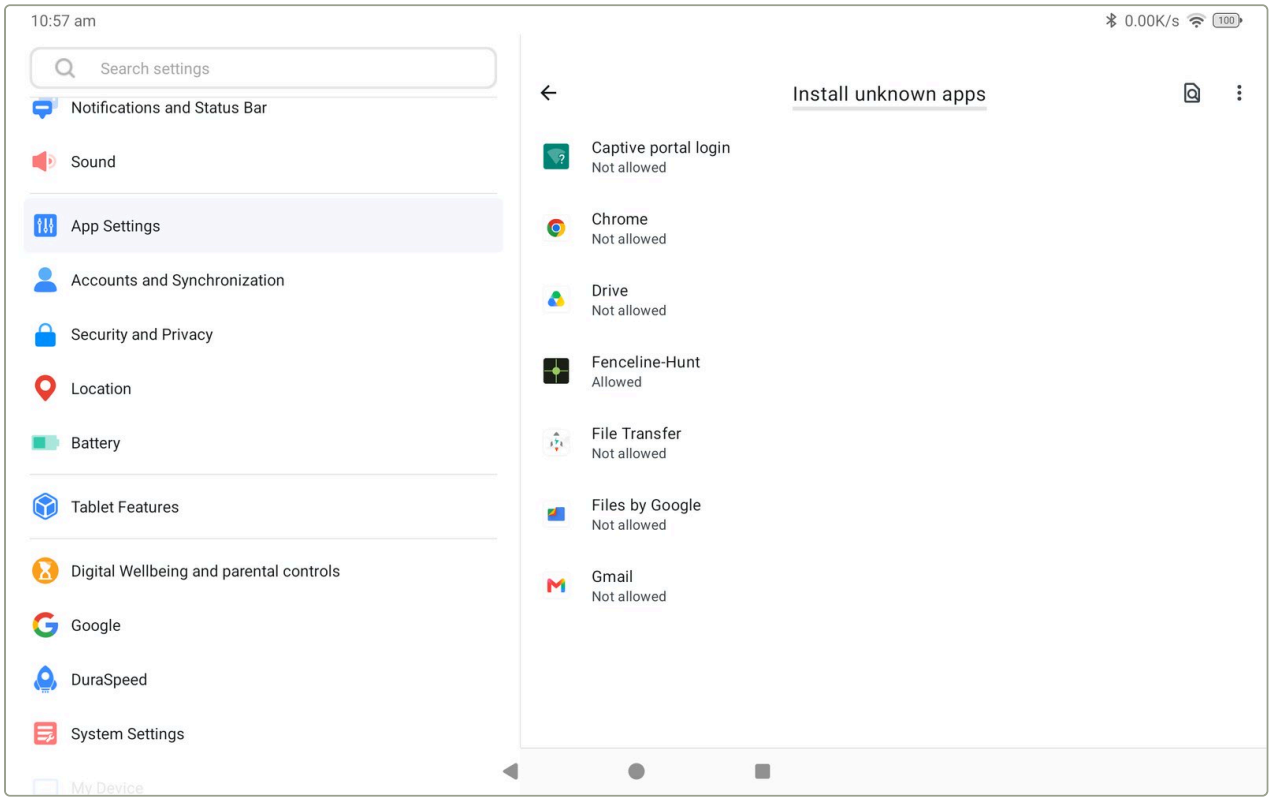

3. The first time only, Android says the phone is not allowed to install apps from this source. Tap **Settings** on that prompt and switch on **Allow from this source** for Fenceline-Hunt, then go back and tap **Install Now** again.
4. Tap **Install**. The update installs over the current app and keeps every trip, property and setting.

The download is checked before Install is offered: the file's size and checksum must match the release exactly, so a bad connection can never leave you with a broken install.

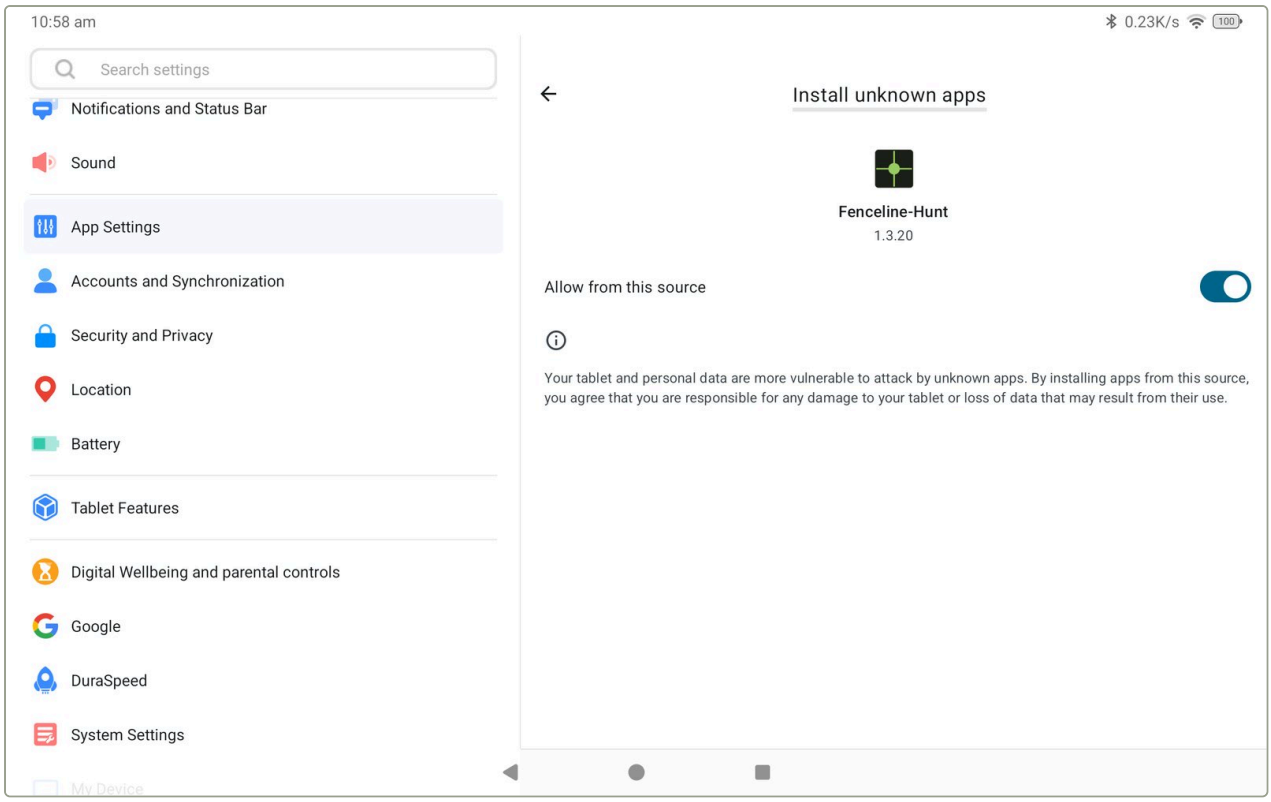

Installing on a brand-new device

There is nothing to update yet on a fresh device, so the first install comes from the APK file itself — emailed to you, downloaded from the releases page, or copied across with a cable. Then:

1. Open the file from your **Files** or **My Files** app and tap it.
2. Android will say the phone is not allowed to install apps from that source the first time. Tap **Settings** on that prompt.
3. Switch on **Allow from this source** for the file manager you are using, then go back.
4. Tap **Install**.

The install-permission list. Each file manager is a separate switch — allow the one you are installing from.

Allow from this source. One switch, then back to the install.

> **Google Play Protect** may show a "Blocked to protect your device" warning for apps installed outside the Play Store. This is Google's standard caution about unknown files, not a problem with the app — tap **Install anyway** and, if asked, allow the app in Play Protect.

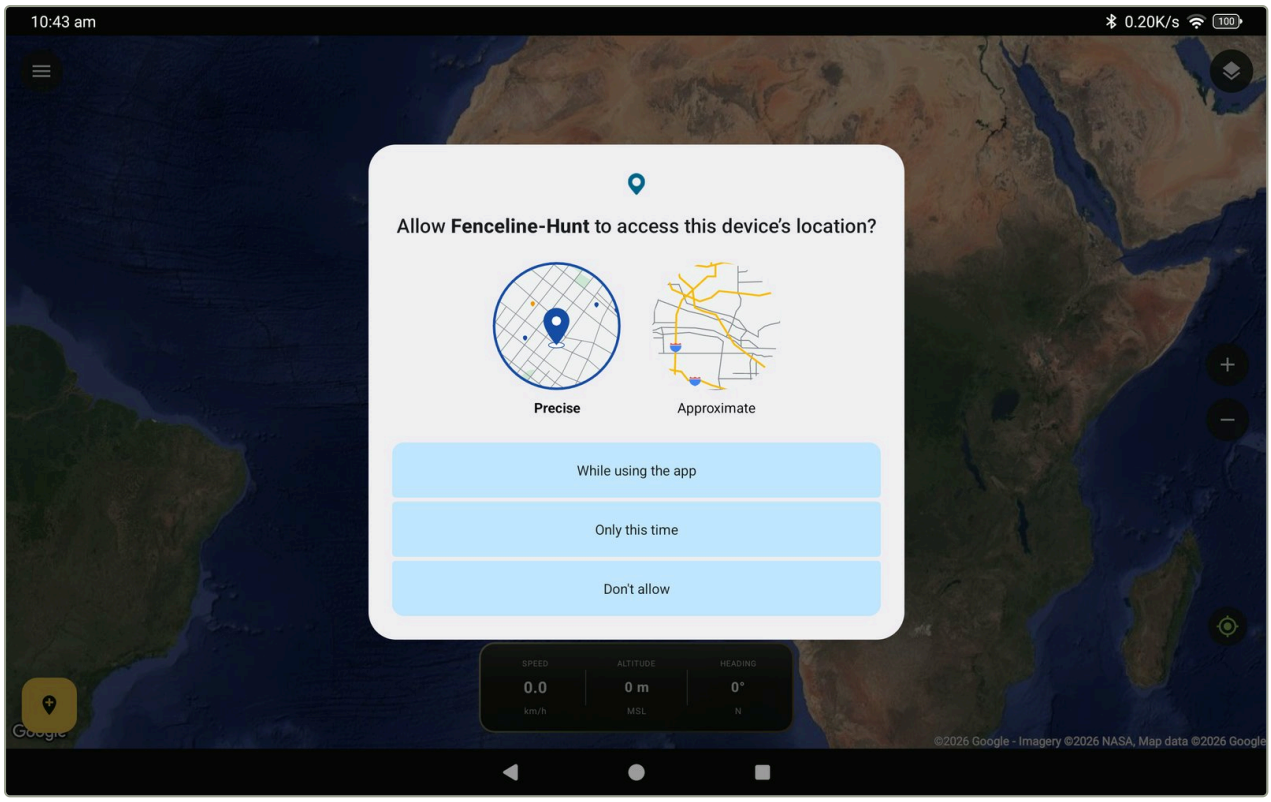

> **Upgrading is safe.** Installing a newer version over the top keeps all trips, properties and settings. Nothing is deleted by an update.

CHAPTER 3

First launch & permissions

What the app asks for the first time it runs, and why.

Recording a trip needs to know where you are, so the first trip will ask for **location permission**. Choose **While using the app** — the app only reads your position while a recording is running or the map is showing your location.

Location permission. "While using the app" is all Fenceline-Hunt needs — recording refuses to start without it.

> **If recording stops in the background**, your phone's battery saver may be dozing the app. In Android Settings, search **Battery optimisation** and set Fenceline-Hunt to **Not optimised** — the tracking notification then runs reliably all day.

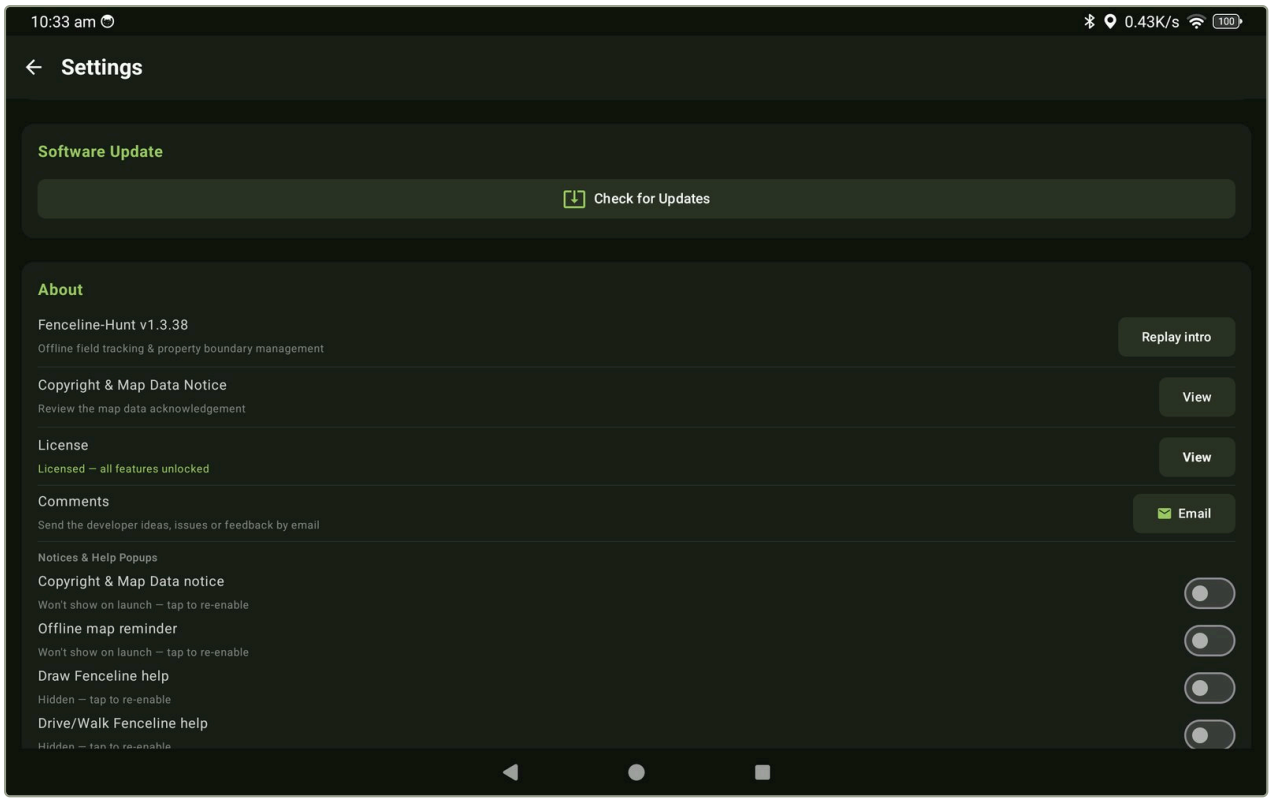

CHAPTER 4

Activating a licence

The free trial, licence keys, and where to enter them.

Fenceline-Hunt starts as a **trial**: you can record a limited number of trips before activating. When the trial is used up, the app shows an activation prompt on launch until a licence key is entered.

1. Order a licence from the developer (see Settings ▸ **Comments** for the contact email).
2. You receive a **licence key** and the **email address** it is issued to.
3. Open the activation prompt, or go to **Menu** ▸ **Settings** ▸ **License**.
4. Type the key and email exactly as issued, then activate.

Licensed. Once a valid key is accepted the app is fully unlocked — the licence screen confirms the state.

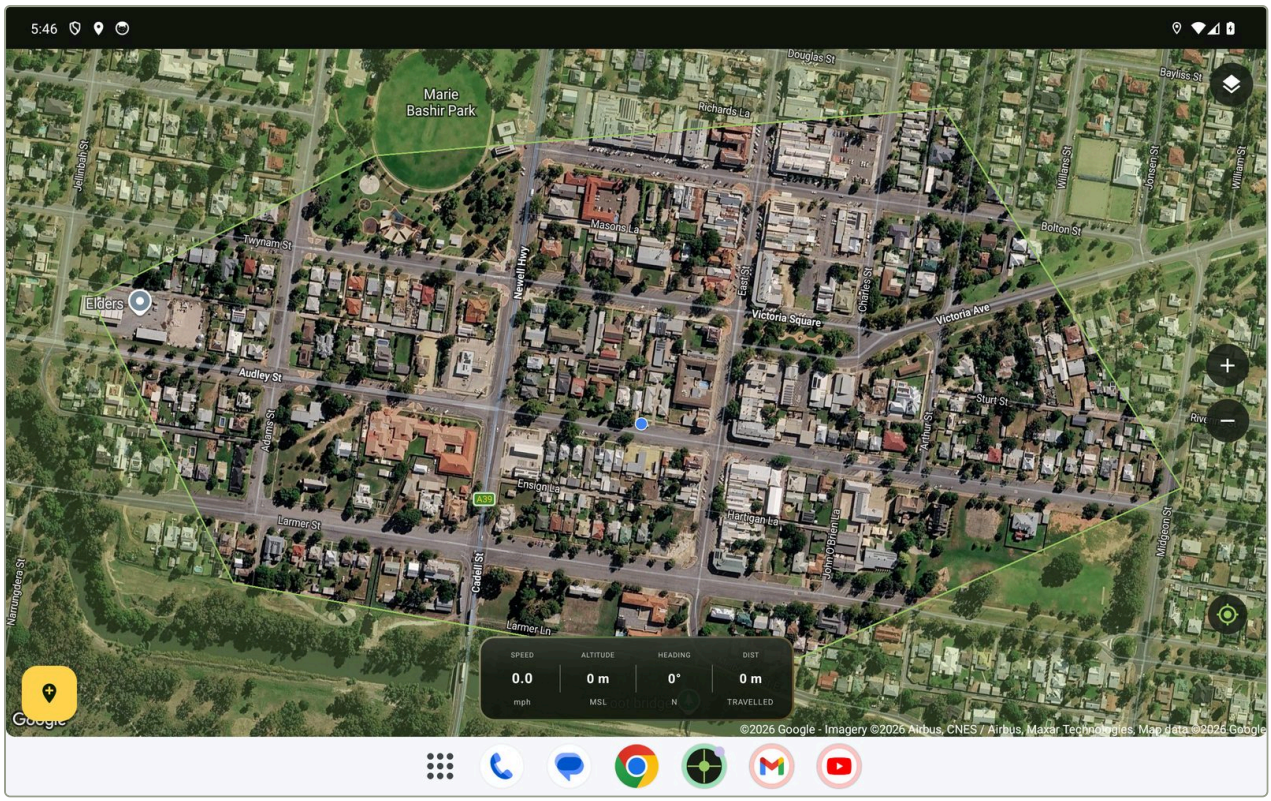

> **Keys are checked online occasionally.** An internet connection is needed the first time a key is validated; after that the app keeps working offline as normal.

CHAPTER 5

Quick start: your first trip

The ten-step short version — each step points into its own chapter.

1. Open **Fenceline-Hunt** and wait for the map to load (Ch. 3).
2. Step outside so the GPS can find you — the accuracy improves within a minute.
3. Save a **boundary map** of the property first if you have one, or skip this and use Free Roam (Ch. 10).
4. Tap the map once — the round record button appears at the bottom-right (Ch. 11).
5. Tap the record button, then confirm on the **Ready to Record?** screen.
6. Walk or drive the boundary at a steady pace. Watch the HUD for speed and distance (Ch. 7).
7. Drop a **pin** for anything worth marking — gates, damage, culls (Ch. 9).
8. Pause any time from the record buttons; resume the same way.
9. At the end, tap **Stop** and **Save** the trip (Ch. 12).
10. See the results in **Trip History** and **Statistics** (Ch. 14, 15).

Recording. The track draws live behind you while the HUD counts speed and distance.

Part B — The map screen

Gestures, the HUD instrument panels, boundary maps and overlays, and drop pins.

CHAPTER 6

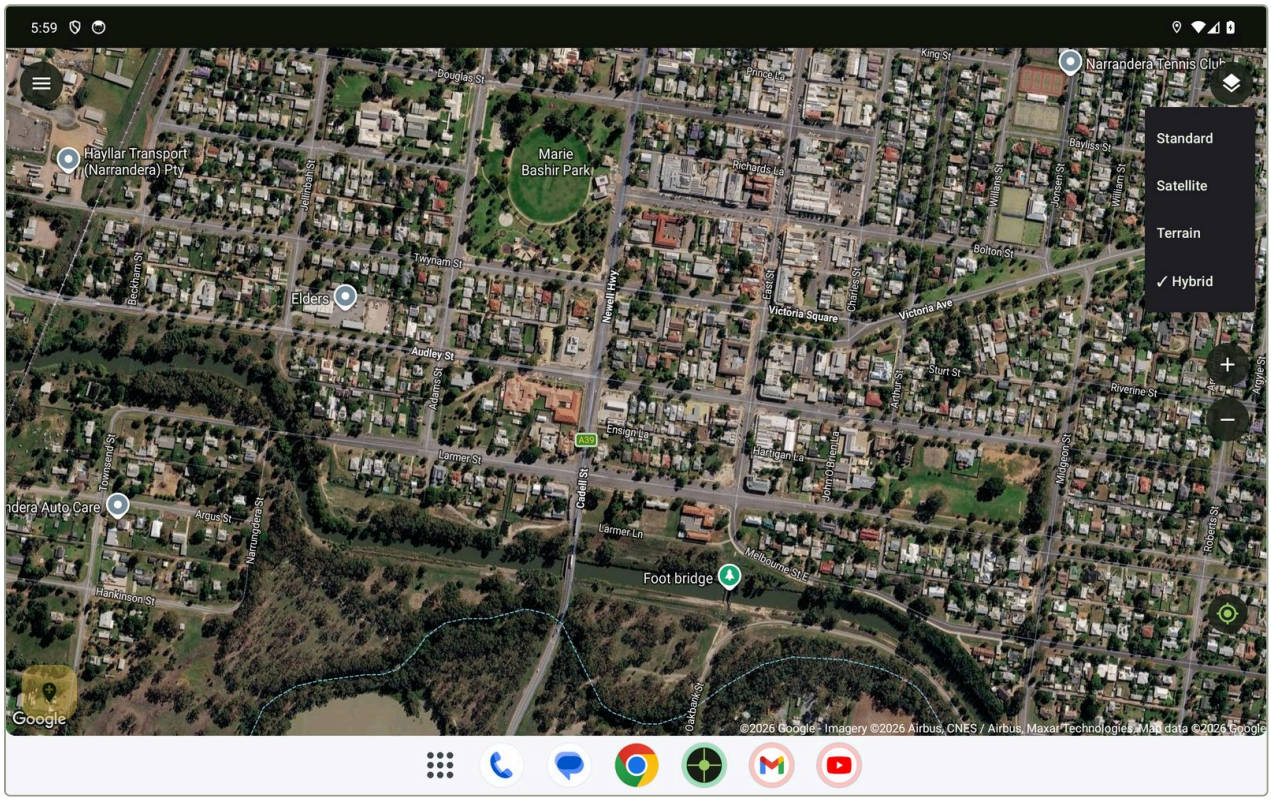

Map basics

Gestures, map types and the on-screen controls.

The map behaves like the map apps you already know:

- **Drag** to pan, **pinch** to zoom, **two-finger twist** to rotate.
- **Zoom + / −** buttons sit on the right edge.
- The **recenter** button (crosshair) snaps the map back to your GPS position and resumes follow mode.

To change the look of the map, tap **Map Type** in the map's top corner:

Map types. Standard for roads, Terrain for contour, Hybrid for satellite imagery with labels.

> **Follow mode.** While following, the map slides with you. The moment you drag the map away, following pauses — tap recenter to resume it.

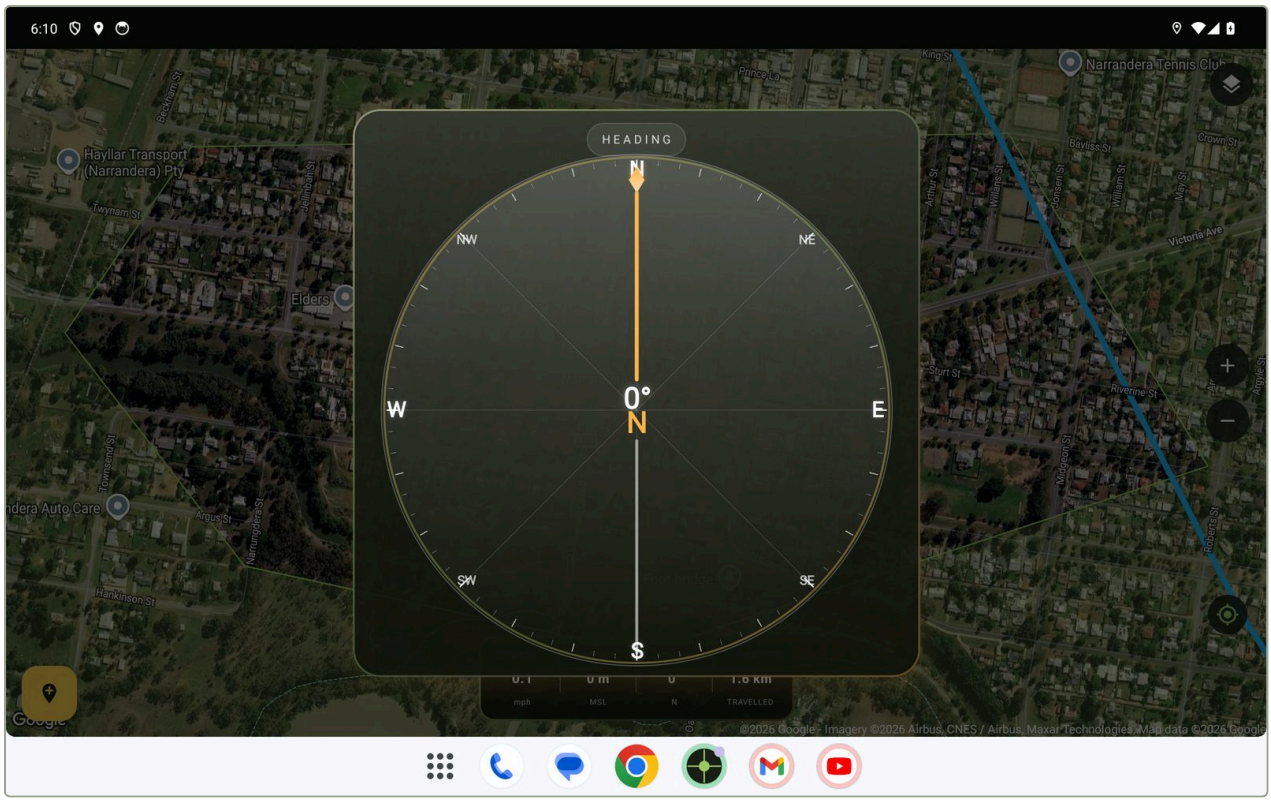

CHAPTER 7

The HUD

Speed, altitude and heading read like glass instrument panels along the bottom of the map.

The three panels are live: **SPEED** in your chosen unit, **ALTITUDE** above sea level, and **HEADING** — the compass direction you are moving. The **DIST** readout between them counts the distance travelled, and when a route to a pin is active, a fourth line shows the straight-line distance and rough arrival time.

Tap any panel — DIST included — to enlarge it to a full instrument face in the middle of the screen; the heading panel becomes a drawn compass with a live needle. Tap anywhere to dismiss it.

The heading instrument. The dial rotates with your travel direction; the needle stays pointed up the screen.

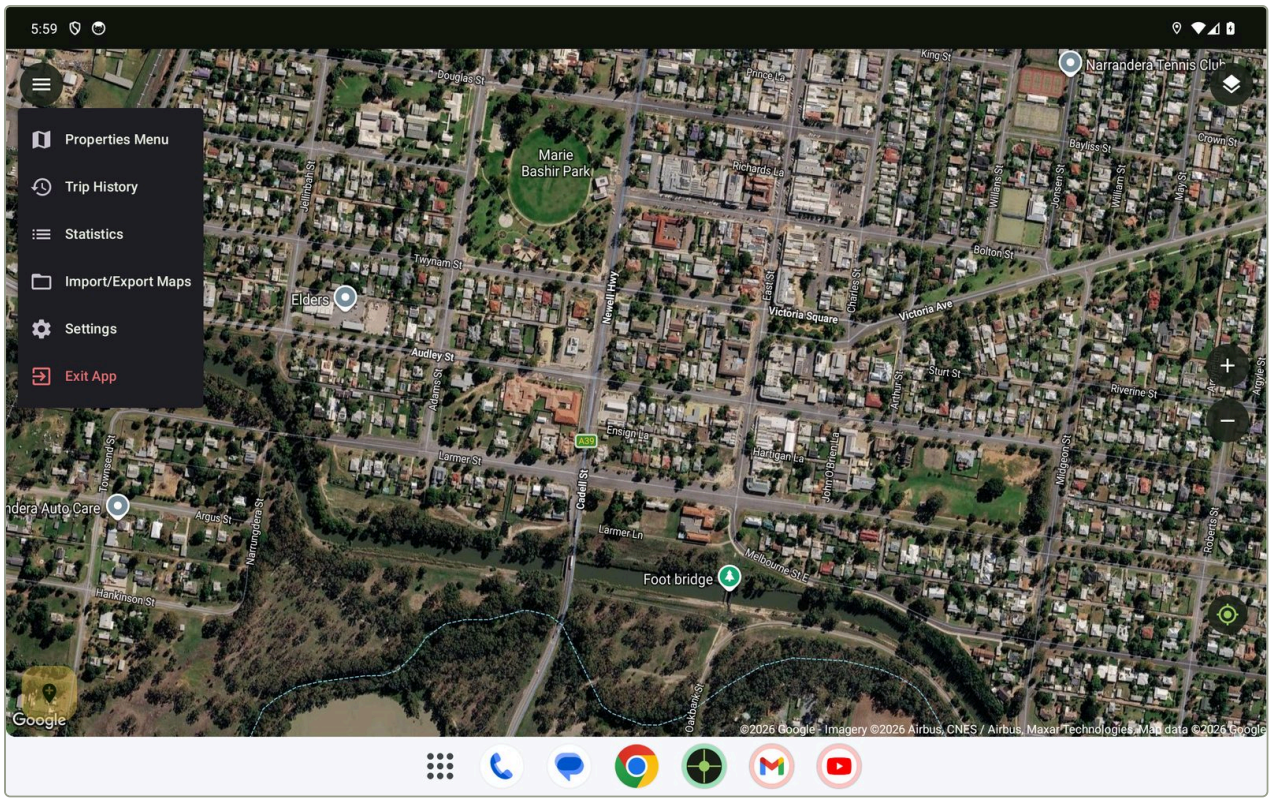

> **Screenshots stay clean.** The HUD hides itself automatically while the app captures a map screenshot, and comes straight back.

CHAPTER 8

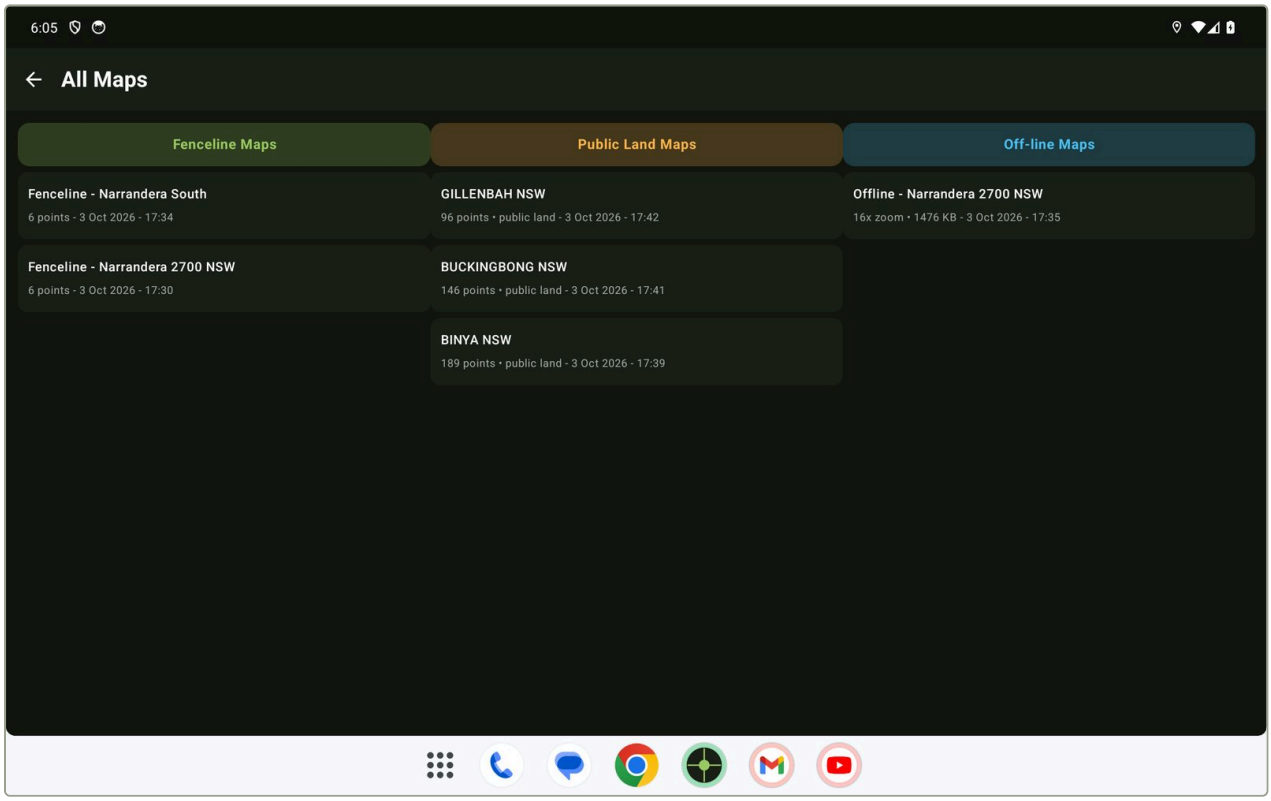

Boundaries & overlays

Fenceline maps, offline basemaps and public-land maps all live in the All Maps screen.

Open **Menu** ▸ **All Maps**. Saved maps are grouped into three columns: your **fenceline** boundary maps, **offline basemaps** (saved map imagery for no-reception areas), and **public land** maps downloaded by state.

The main menu. All Maps, Properties, Import/Export, Trip History, Statistics and Settings are all reached from here.

All Maps. Each tile shows its date. Tap a tile to select it as the active boundary or overlay; tap again to discard it.

> **Overlays stack.** You can draw an offline basemap underneath and a public-land map on top. Discarding an overlay never deletes the saved map itself.

> **Fencelines drawn on offline basemaps keep their imagery.** In the Select Map Boundary sheet, a boundary you recorded over an offline basemap lists under the **Off-line Maps** tab (not Fenceline Maps) — and picking it keeps that saved imagery on screen beneath the boundary, even with no signal.

> **Public-land maps show their state.** Downloaded maps are named with the state they came from (for example "CANDOLE NSW" or "Big Desert State Forest VIC"), so two forests with similar names are easy to tell apart. Maps downloaded before this change are renamed once on the next launch.

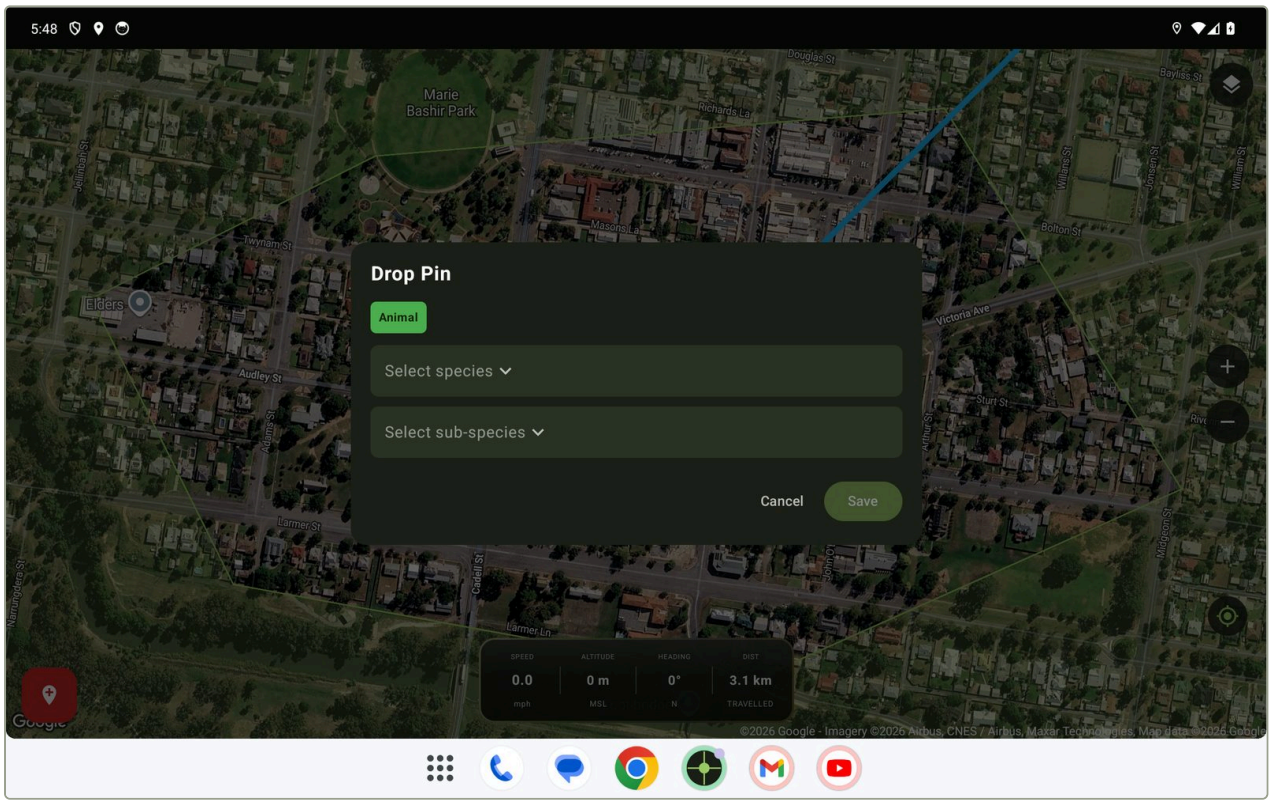

> **New offline basemaps are named for you.** When you save a capture the name is pre-filled from the area you recorded (for example "Offline - Newcastle 2300 NSW") — edit it if you prefer. Opening a saved basemap for edit first asks whether to **Recapture Image** or **Add Fenceline to Map**, so you cannot lose a boundary you already drew on it by accident.

CHAPTER 9

Drop pins & features

Mark gates, damage and culls while a recording runs.

1. While a recording is running, tap the map once so the round buttons appear.
2. Tap the amber **pin button** at the bottom-left to arm placement mode.
3. Tap the map where the feature is — the other pins shrink to small dots while placement mode is armed, so a tap right next to a pin still lands where you aimed.
4. Choose what the pin marks (gate, damage, cull and so on), add a note or photo if needed, and save. Placement mode exits and the full pins return.

The pin popup. Pick the feature type, add detail, and save — the pin is attached to the running trip.

> **Cancelling the popup also disarms placement mode** — if you want to drop another pin, tap the pin button again. This stops accidental double-pins.

> **You choose what the cull menu offers.** The species and sub-types in the cull pin menu can be trimmed to what you actually shoot — see **Cull Species Sub-Types** in Chapter 20.

Part C — Recording trips

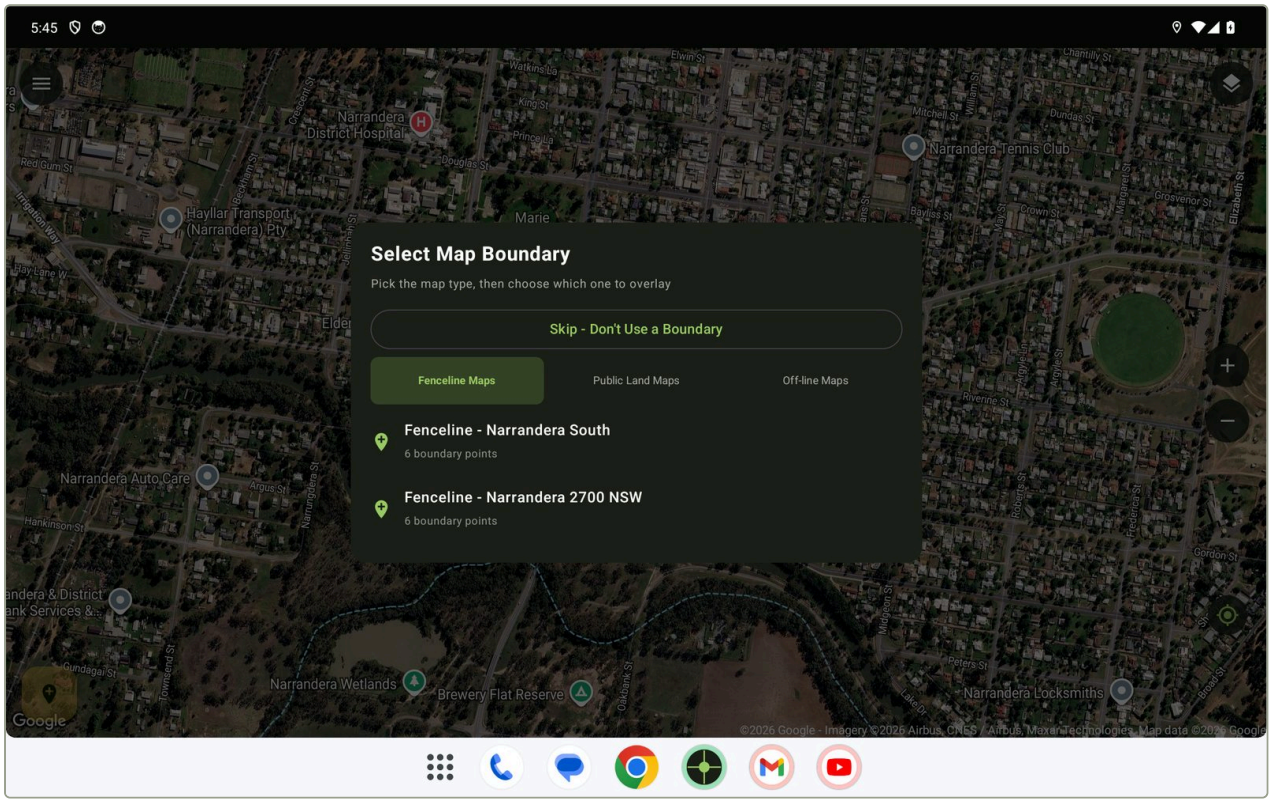

Boundaries, starting and pausing, saving, background behaviour and Trip History.

CHAPTER 10

Choosing a boundary

Record against a saved property map, or roam free.

When you start a recording the **Select Map Boundary** sheet lists your saved fenceline maps by category. Picking one ties the trip to that property — its boundary draws behind your track, and the trip is grouped under that property in Statistics.

The boundary sheet. Saved boundary maps grouped by category, with the option to skip at the bottom.

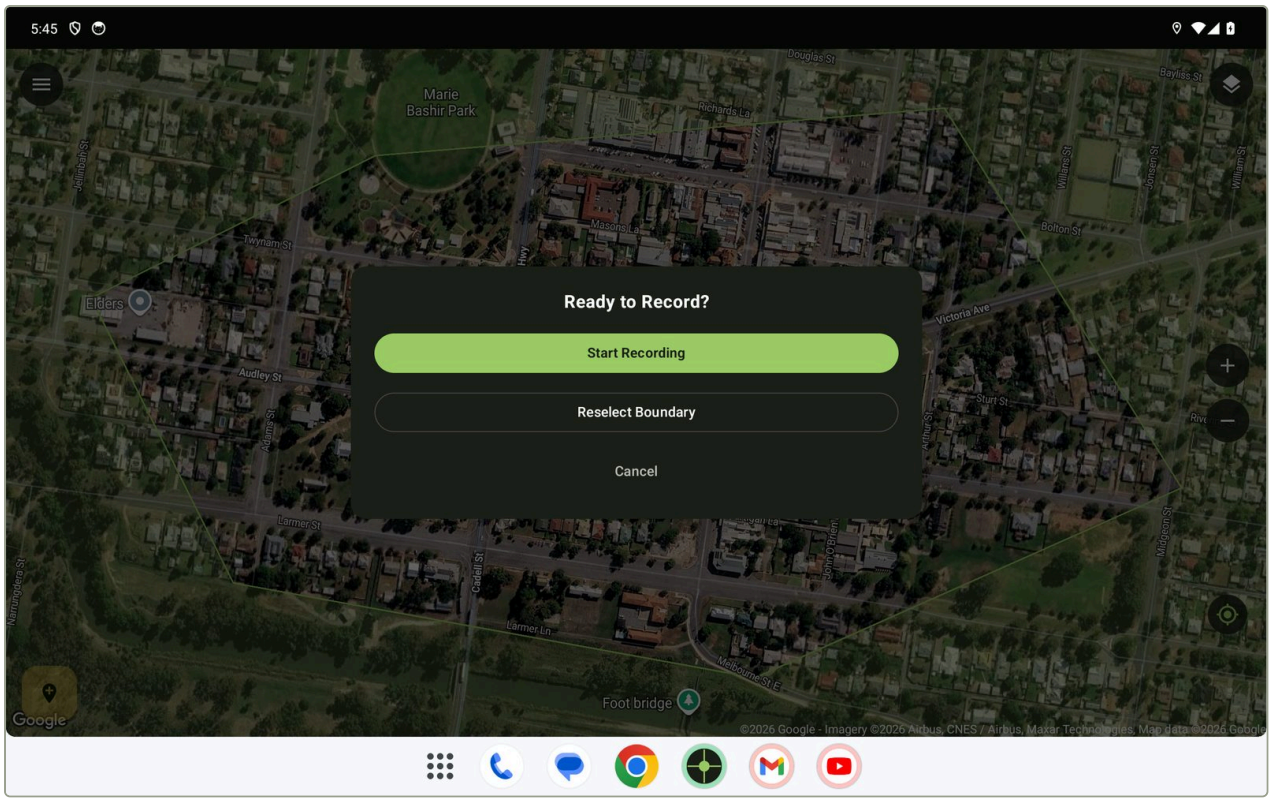

> **Skip — Don't Use a Boundary** records a Free Roam trip: the track still saves, but no property is attached. Useful for exploring an unfenced block.

CHAPTER 11

Starting, pausing, resuming

The record buttons, the commitment dialog, and how distance is counted.

1. Tap the map once — the round record button appears at the bottom-right corner. (It hides itself while you are panning so it never blocks the map.)
2. Tap the record button.
3. Read the **Ready to Record?** screen. It confirms the boundary you picked and reminds you the recording follows you until you stop it.
4. Tap **Start Recording**.

Ready to Record? A deliberate pause before the GPS starts — a recording is meant to last the whole trip.

While recording, the round buttons become **pause** and **stop**. Pause holds the track (useful at a gate or a long stop); resume continues the same trip. Distance only accumulates while the track is moving — standing still adds nothing.

CHAPTER 12

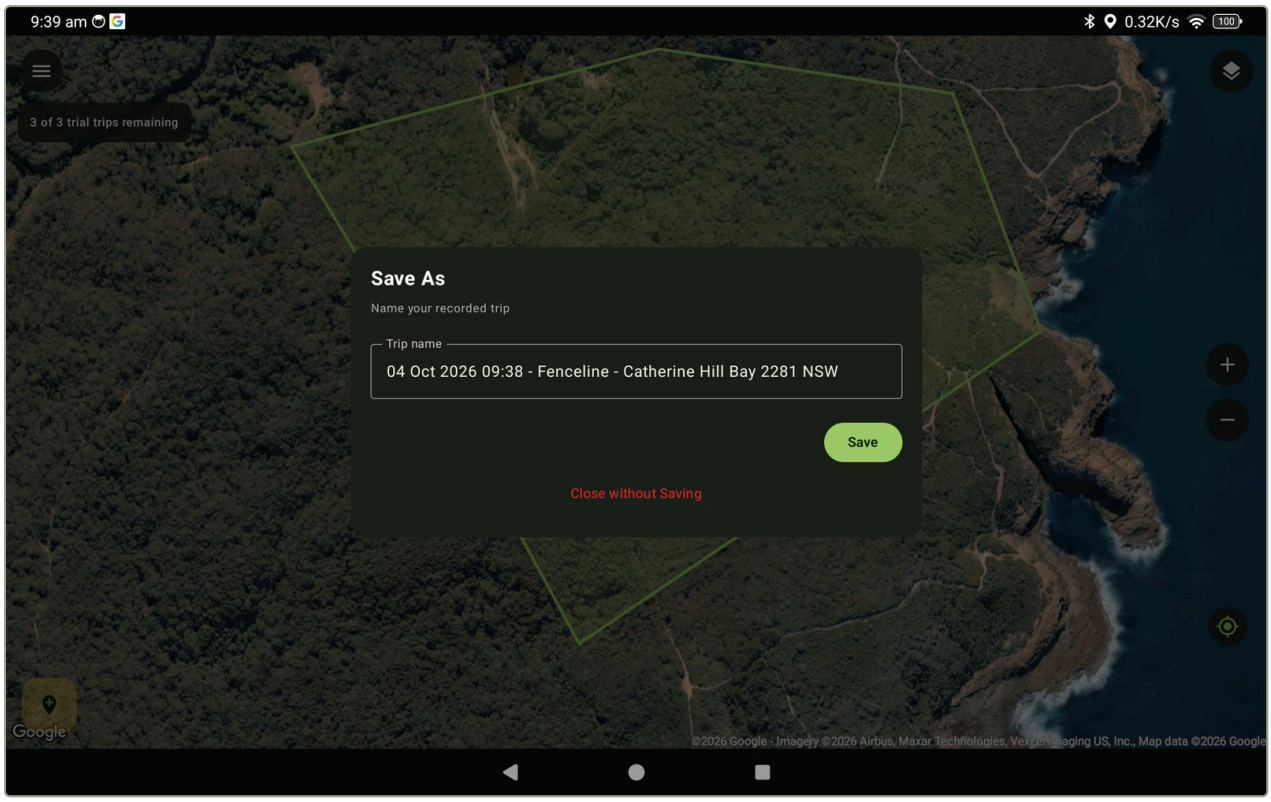

Stopping & saving your trip

Finish a recording and keep it — or walk away without saving anything.

When you reach the end of the boundary, stop the recording:

1. Tap the map once so the record buttons appear at the bottom-right.
2. Tap the **Stop** button (square icon).
3. The **Save As** dialog appears with a suggested trip name based on the boundary you recorded.
4. Tap **Save** to keep the trip — the name box already shows the suggested name, so just edit it first if you want something different.

> **The snapshot stays clean.** The image saved with the trip shows the map, the fenceline used, your trail and this trip's animal pins — the HUD, buttons and menus stay out of the shot.

The Save As dialog. The trip is named after the boundary by default — you can type your own before saving.

> **Same name, same day? The app numbers them for you.** If you save two trips with the same name on the same day, the newest keeps the plain name and each older one gains a **#1**, **#2**, … suffix, so the trip list never shows two bare duplicates. The timestamp at the front of the name is ignored when the names are compared, and any same-day duplicates saved before this build are renumbered once on the next launch.

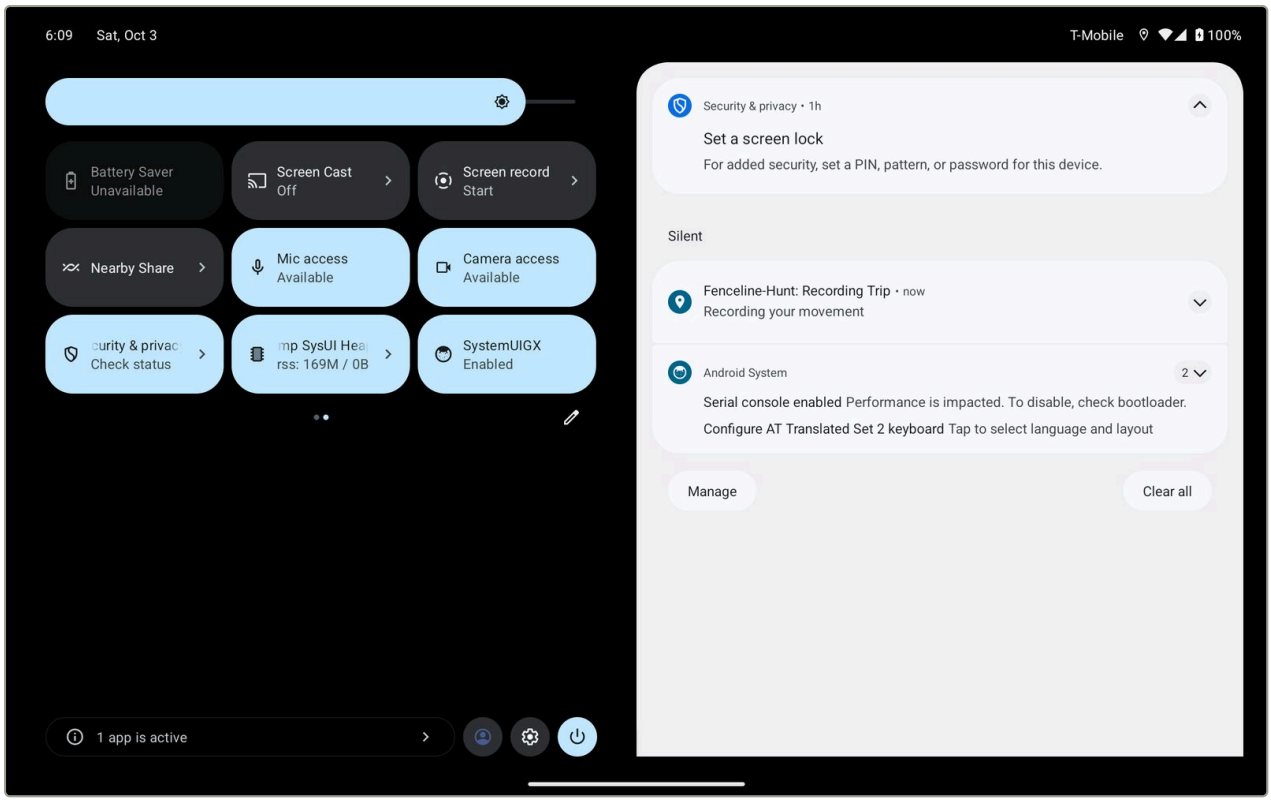

> **Close without Saving** throws the recording away — the track and any pins are not kept, and the drawn boundary is cleared. You will be asked to confirm.

CHAPTER 13

Swipe-to-close & background behaviour

What happens when you leave the app — deliberately or by accident.

While a recording runs, Android shows a **tracking notification**: "Fenceline-Hunt — Recording Trip" with the elapsed time. The recording continues with the app in the background; you can answer calls, navigate home, or lock the screen.

The tracking notification. Tap it to jump back into the app; it is also the reminder that a recording is still running.

> **Swiping the app away stops and saves the recording** — it does not keep running in the background or silently restart. If you see the notification disappear, your trip was saved up to that moment.

> **After a phone restart**, the app detects the interrupted recording on next launch and recovers the trip — you are asked to confirm the save.

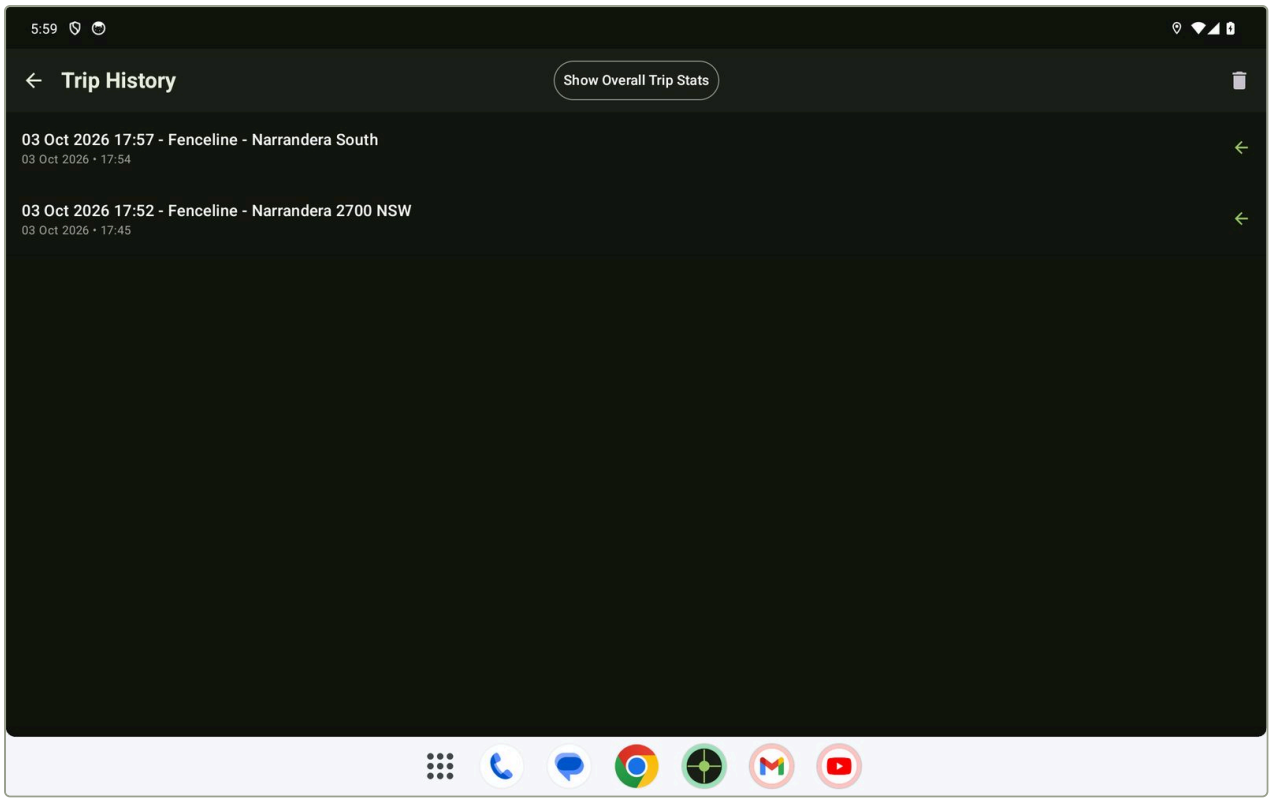

CHAPTER 14

Trip History

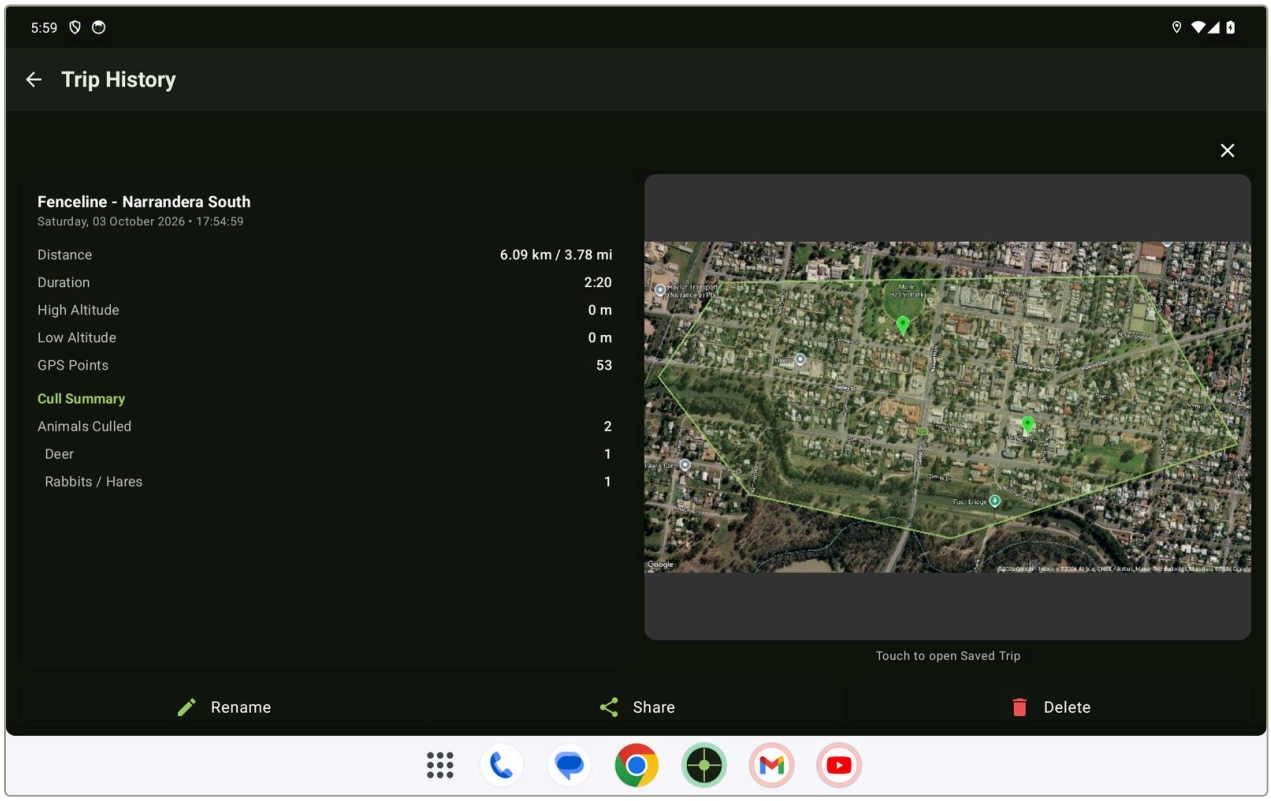

Reopening trips, drawing them again, and renaming or sharing them.

Open **Menu** ▸ **Trip History** for every saved trip, newest first. Tap a trip to reopen it: the track draws on the map with the boundary and basemap it was recorded against, plus its stats card and any saved screenshot.

On the trip detail, the map snapshot beside the stats is labelled **Touch to open Saved Trip**. Tapping it opens the trip full-screen on the map, framed on that trip's own trail and boundary — not on your current location — with a **Close Saved Trip** button at the top to return to Trip History.

Trip History. Each row shows the property, date, distance and duration.

Trip detail. The stats card and snapshot sit alongside the Rename / Share / Delete actions.

When the trip was recorded against a fenceline, the stats card also reports the land that fenceline encloses, in hectares and acres — the same figure every other fenceline readout uses.

- **Rename** — give the trip a name you will recognise later.
- **Share** — export the track as GPX, KML or KMZ to any app (email, drive, mapping tools).
- **Delete** — removes the trip permanently, after a two-step confirmation.

Part D — Statistics & cull records

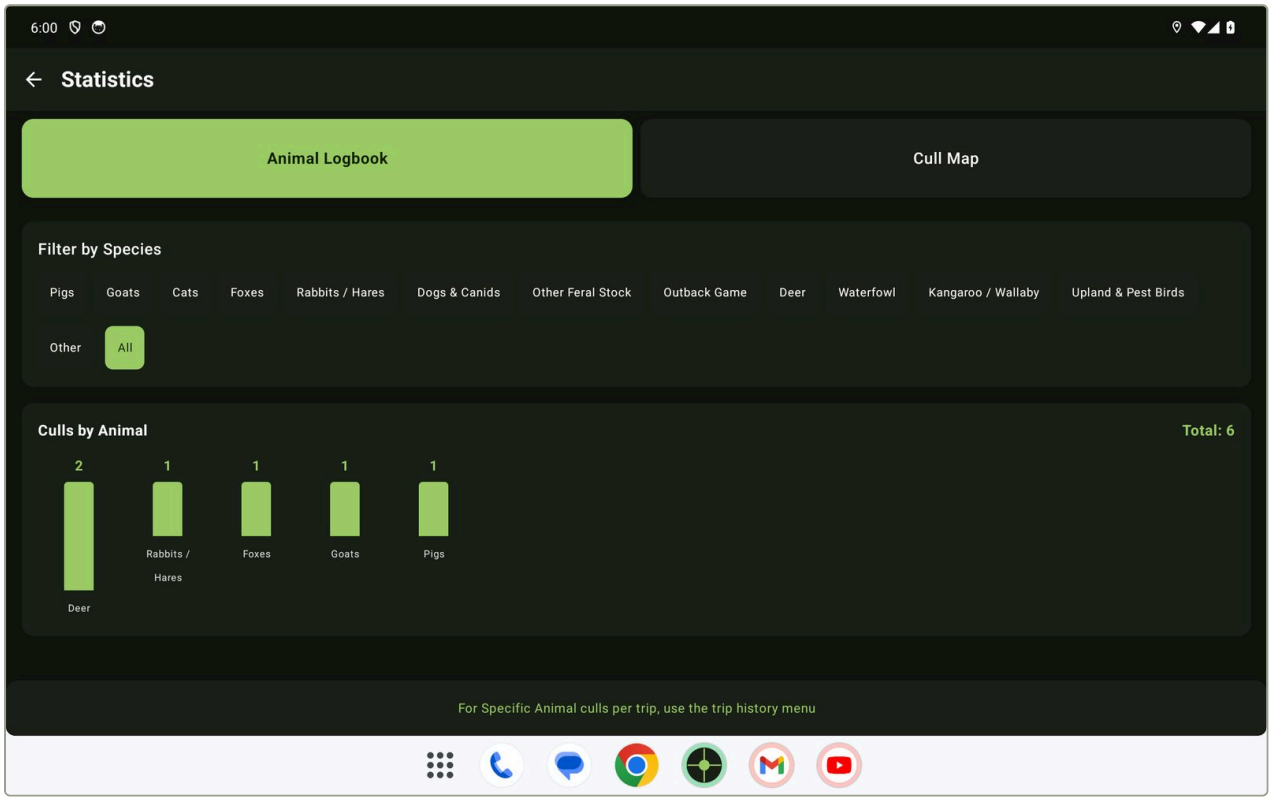

The Statistics hub, the Animal Logbook, and combining trips onto one collated map.

CHAPTER 15

The Statistics hub

One screen for the work you have done — totals, this month, top species.

Open **Menu** ▸ **Statistics**. The summary cards total your culls, this month's culls, your top species and your trips. Below the cards, the **Culls by Animal** graph breaks the totals down by species.

The hub. Cards summarise the totals; the bar graph shows culls per species, and per sub-type when a species is selected.

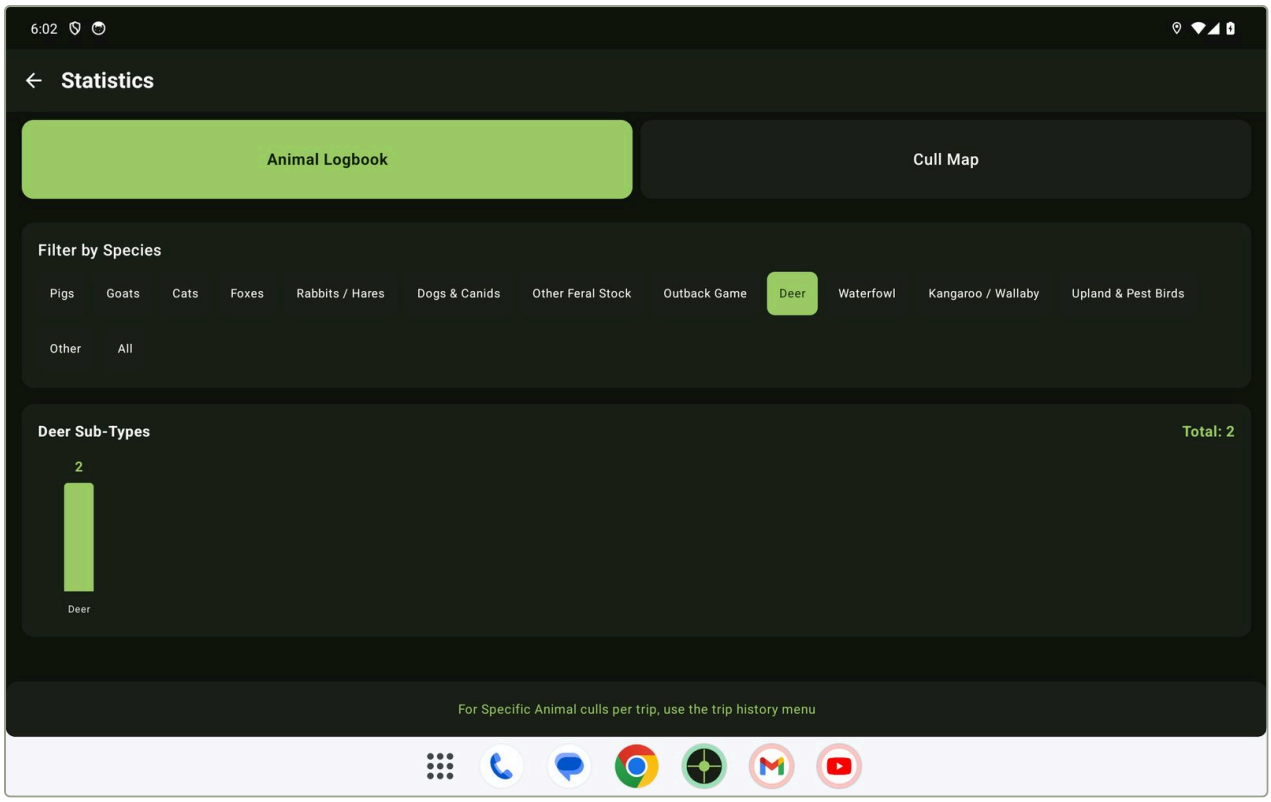

Two tabs sit at the top: **Animal Logbook** (Ch. 16) and **Cull Map** (Ch. 17).

CHAPTER 16

Animal Logbook

Your running record of every cull, with species filters.

The logbook lists culls with their species, and the filter chips let you narrow the view — tap **Foxes** to see only foxes, tap **All** to clear the filter. The graph switches from full categories to sub-types when a specific animal is selected.

The logbook. Filter chips at the top, the culls-by-animal graph below.

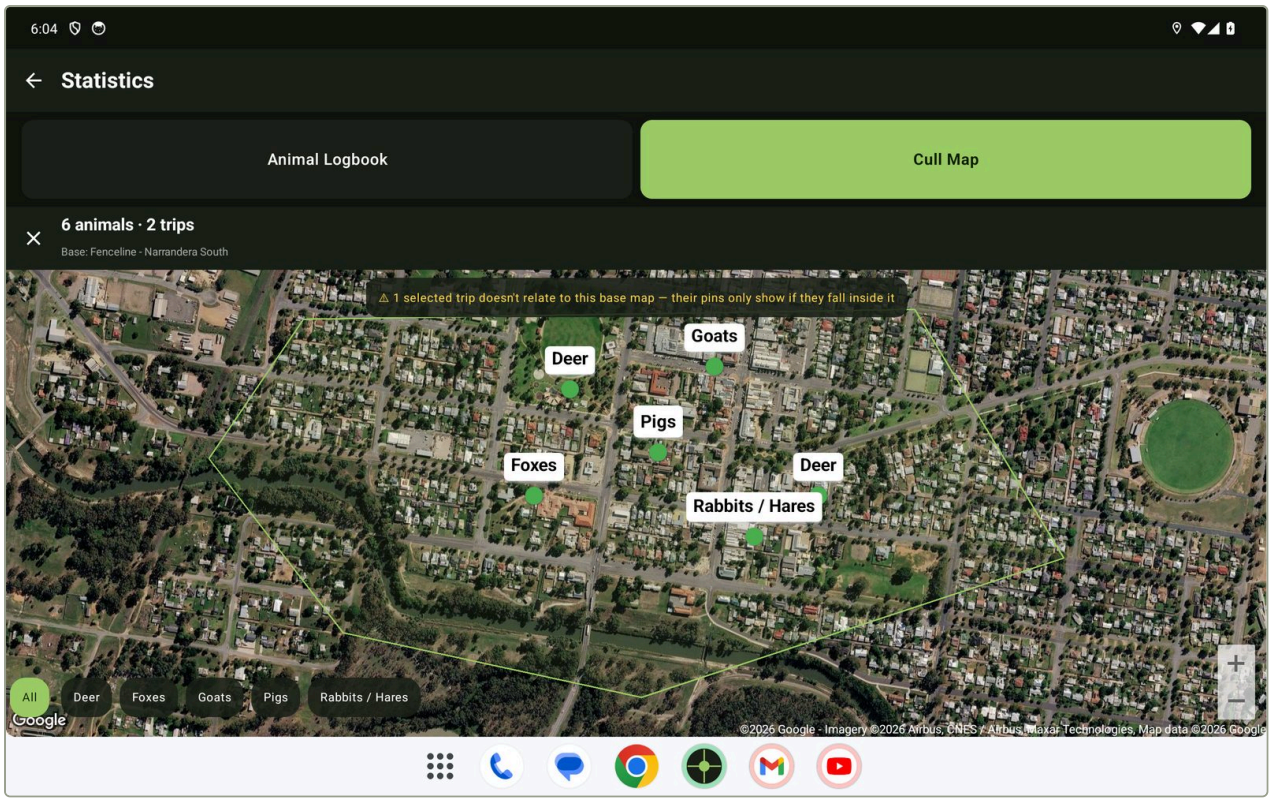

> **Culls are logged from drop pins during a recording** (Ch. 9) — that keeps the position and trip attached automatically. There is no add button on the logbook itself, so a fresh install starts empty until the first recorded trip.

CHAPTER 17

Collated cull map

Combine several trips onto one map to see the full cull picture for a property.

Open **Statistics** ▸ **Cull Map**, tick the trips you want to combine, then tap **Show Collated Map**. The saved boundary those trips were recorded against becomes the base map, with every animal pin from the selected trips drawn on top.

Two trips combined. The header counts animals and trips; chips along the bottom filter by species. If a selected trip was recorded against a different map, the app asks before including it.

Counting rules

Rule	What it means
No double-counting	An animal pin belongs to the trip it was dropped in; combining trips never duplicates a pin.
Related trips only	Trips recorded against a different base map are flagged — their pins only show if they fall inside the base map.
Clusters	Pins that overlap at low zoom merge into a ×N bubble; zoom in to separate them.

Part E — Data & settings

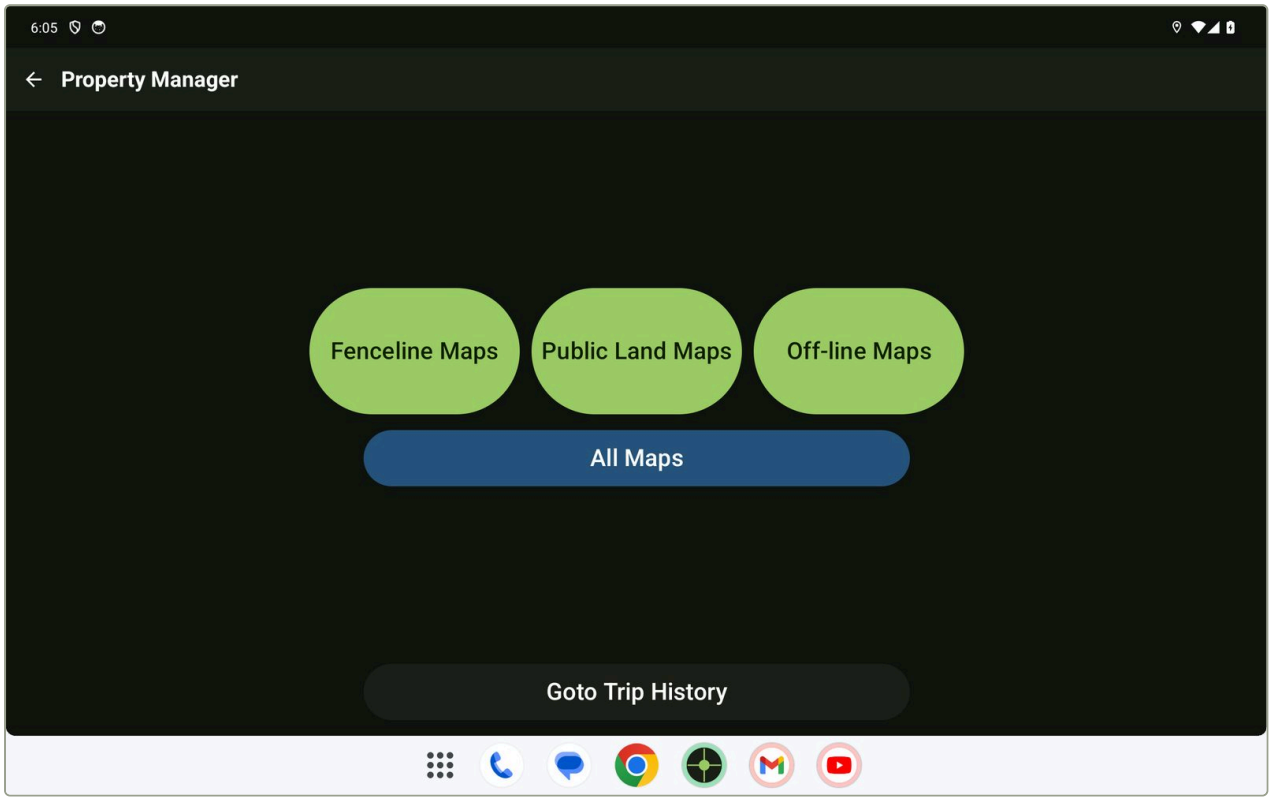

Properties, importing and exporting, every setting explained, and how your data is stored.

CHAPTER 18

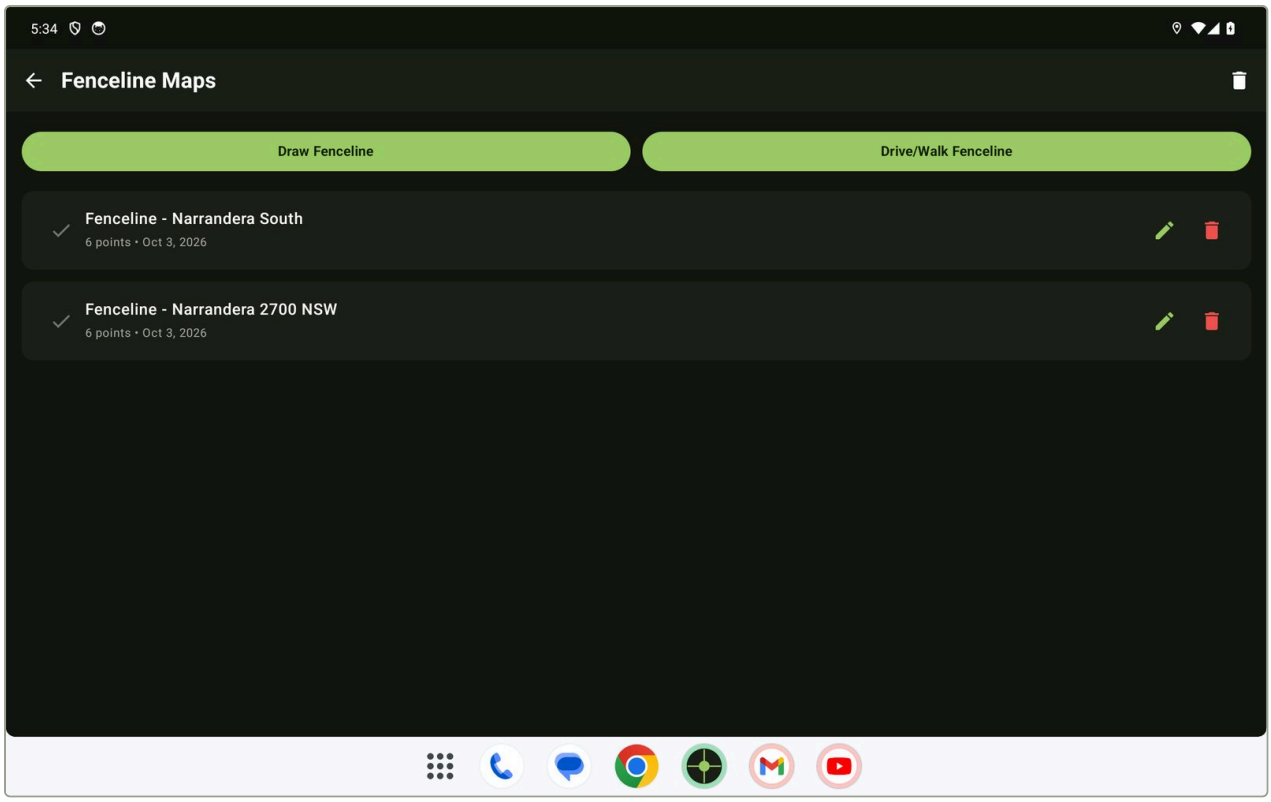

Properties

Managing property boundaries — the fencelines your trips are recorded against.

Open **Menu** ▸ **Properties**. Each property shows as a tile with its area; tap through to the fenceline list for that property.

Property Manager. One tile per property; tap to open its fencelines.

The fenceline list. Boundaries recorded for the property, with the tools to draw, rename or remove them.

> **Fencelines are drawn, not recorded.** Use the drawing tools to trace a boundary on the map, then save it — recorded trips then snap to that property for Statistics and collation. You can also **record** a boundary by driving or walking it — see Chapter 18A.

CHAPTER 18A

Drive/Walk Fenceline — record a boundary

Can't trace the fence on the map? Drive or walk it — the GPS does the drawing.

Open **Menu** ▸ **Properties** ▸ **Fenceline Maps** ▸ **Drive/Walk Fenceline**. The screen opens on an empty satellite map with a search bar, a **use current location** button (the crosshair beside the search bar) and a recenter button — nothing records until you ask it to.

> **First-time help.** A short how-to popup appears the first time you open Draw or Drive/Walk Fenceline. Tick **Don't show again** to dismiss it for good, or switch it back on in **Settings** ▸ **Notices & Help Popups**.

1. Get to the start

Search for the property or tap **use current location** to jump to where you're standing. The blue dot shows your GPS position at all times; tap the recenter button (bottom-right) to snap the map back to it whenever you like.

2. Record the track

1. Tap the map once — the green **record button** appears at the bottom-right. (It hides itself again after a few seconds, and panning never summons it — same behaviour as the trip recorder.)
2. Tap the record button. The status chip at the bottom-left turns red with **REC** and a live distance.
3. Drive or walk the boundary. Your path draws as a **dotted line** — deliberately no pins while you move, so the map stays readable at any length.

4. At a gate or a long hold, tap the map and press **pause** (amber). The track freezes — "RECORDING PAUSED" banner confirms it — and **resume** continues the same line when you get going again.

While recording, the search bar and editing tools step out of the way. The only things on screen are the track, the readouts along the top (DIST / AREA / PERIM), and the pause/stop controls.

3. Stop — the track becomes pins

1. Tap the map and press the red **stop** button.
2. The dotted line converts into a small set of **evenly spaced red pins** — GPS wobble is simplified away, corners are kept, and roughly one pin lands every 20 metres. A 1 km drive becomes about 50 pins, not hundreds.
3. If the two ends don't meet, a **Close the Fenceline?** dialog offers to create the closing link and save, or keep editing.
4. The **Save Fenceline** dialog opens with a name from the location ("Fenceline - Suburb Postcode State").

4. Fix it up before saving

The save dialog offers three choices:

- **Save** — commit the fenceline. It lands in Fenceline Maps like any hand-drawn boundary: editable, exportable, usable for trips and Statistics.
- **Edit Map Now** — dismiss the dialog and fix the pins first. The full drawing toolbar appears: **Add** (tap to drop a pin), **Ins** (tap the line to insert one), **Edit** (drag a pin), **Del** (remove one), **All** (start over), **Undo**. Tap the first pin to close the ring. The green **Save** button reopens the dialog when you're happy.
- **Cancel** — same as Edit Map Now; nothing is saved and the pins stay for editing.

5. Continue recording later

Missed a leg? Press record again after a stop — a fresh dotted track starts, and the next **stop appends its pins to the ones already on the map**. Your manual edits are kept. Tap the first pin to close the ring when the whole boundary is captured.

> **Feature pins work while recording.** The amber pin button (bottom-left) drops gates, damage and other features mid-drive — they're saved with the fenceline like any other feature.

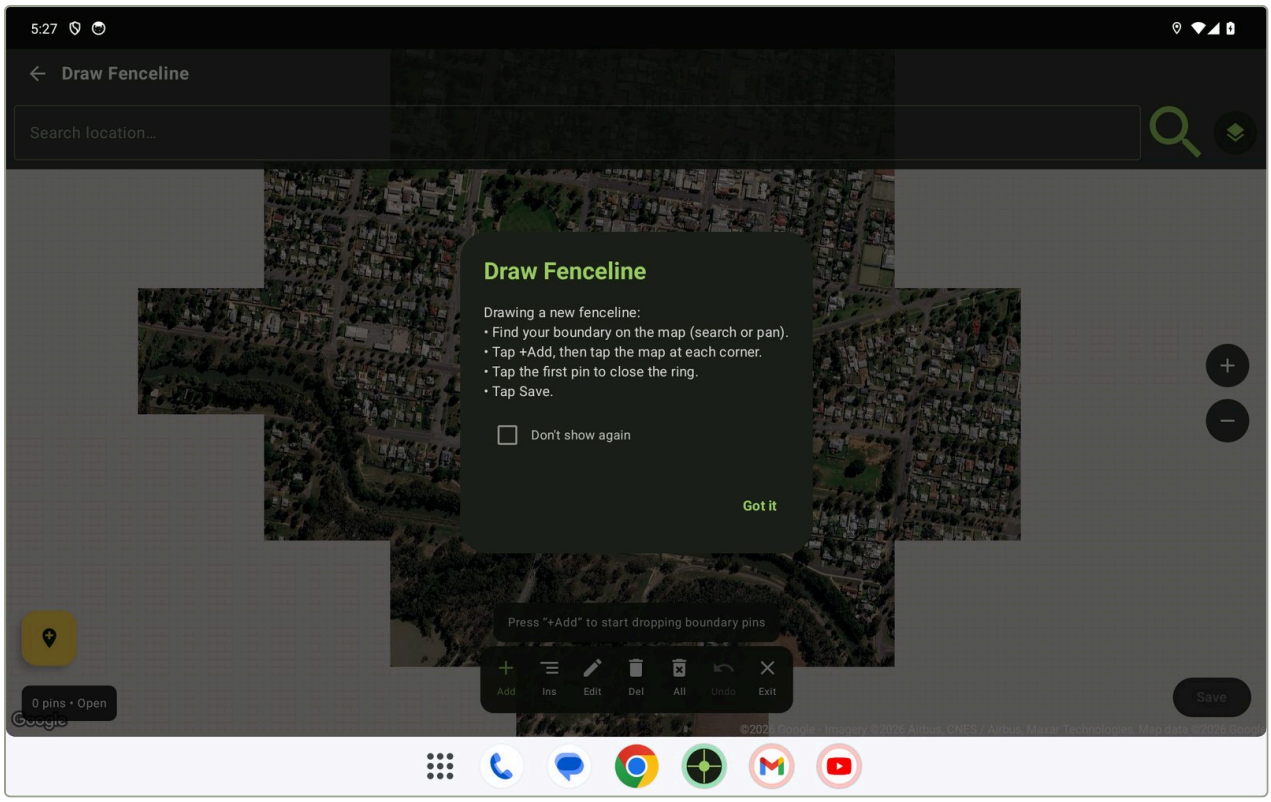

> **Backing out with unsaved work** prompts to save or discard — a recorded track is never thrown away silently.

CHAPTER 18B

Draw Fenceline — trace a boundary

Trace a boundary corner by corner on the map, then save it as a fenceline.

Open **Menu** ▸ **Properties** ▸ **Fenceline Maps** ▸ **Draw Fenceline**. On a fresh draw the map opens with a search bar at the top and the short **how-to popup**.

The Draw Fenceline how-to. Find your boundary, tap **+Add**, tap each corner, close the ring, then **Save**. Tick **Don't show again** to stop it returning — Settings ▸ Notices & Help Popups switches it back on.

1. Find the boundary on the map — search, or pan and zoom to it.
2. Tap **+Add**. Nothing is placed until you do: the search bar hides and the map arms for pin drops, so a stray tap cannot drop a pin while you are still looking around.
3. Tap the map at each corner. The pins join into a red dotted line as you go.
4. Tap the first pin to close the ring, then tap **Save** and give the fenceline a name.

The editing toolbar along the bottom holds **Add**, **Ins** (insert a pin on the line), **Edit** (drag a pin), **Del**, **All** (start over) and **Undo**.

> **Undo reverses the last change**, not just the last pin — an add, insert, move, delete or feature pin. On a saved fenceline opened for edit, Undo can never take the boundary past how it was saved: the saved map is the floor, and Undo greys out again once you are back to it.

> **Edit an existing fenceline** from Fenceline Maps — open the row, then choose Edit Fenceline. Pin dragging, insert and delete work the same way; press **Update** to save.

CHAPTER 19

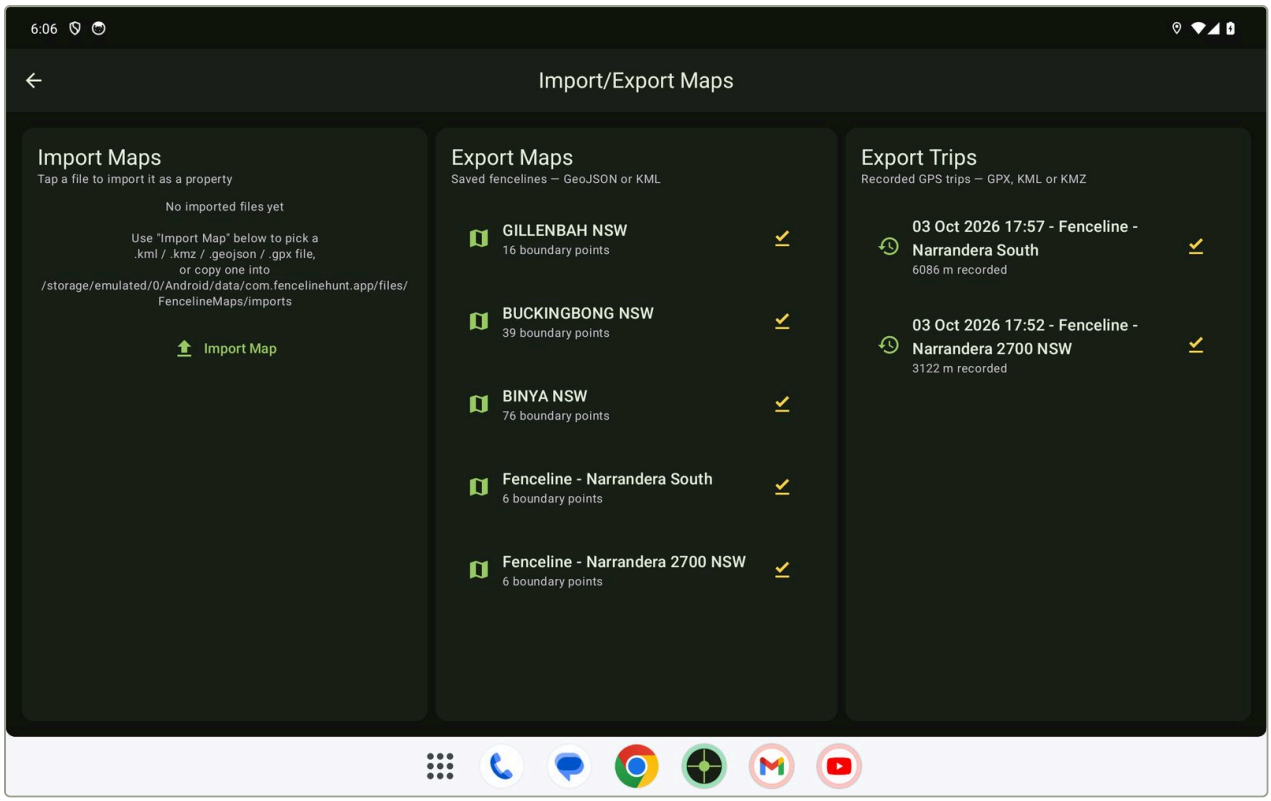

Import & Export

Bring boundaries in, send maps out, and keep backups.

Open **Menu** ▸ **Import/Export**. The screen is organised into three columns, one for each kind of data:

- **Import Maps** — read KML and GeoJSON files. Property boundaries drawn in Google Earth or sent by a neighbour come straight onto the map; imported files are listed with their status.
- **Export Maps** — every saved fenceline, exportable as GeoJSON or KML for backup or sharing.
- **Export Trips** — every recorded GPS trip, exportable as GPX, KML or KMZ with its animal pins.

On a narrow phone the same three cards stack vertically.

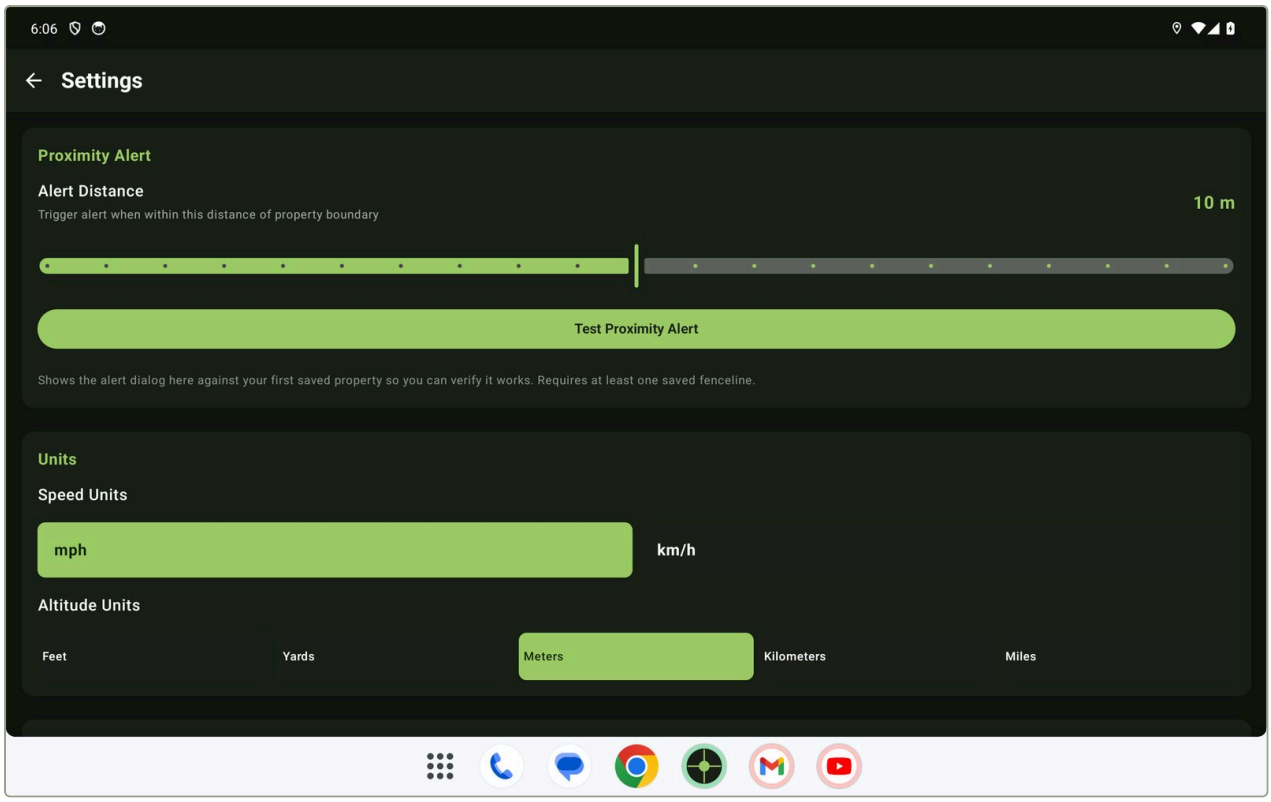

Import/Export. Import Maps, Export Maps and Export Trips — each kind of data in its own column.

> **Backups before changing phones.** Export your properties and fencelines to a file and email it to yourself — importing it on a new device rebuilds your boundaries.

CHAPTER 20

Settings reference

Every setting, what it does, and where it lives.

Settings. Units, map layer and proximity alerts at the top; data, notices and app info further down.

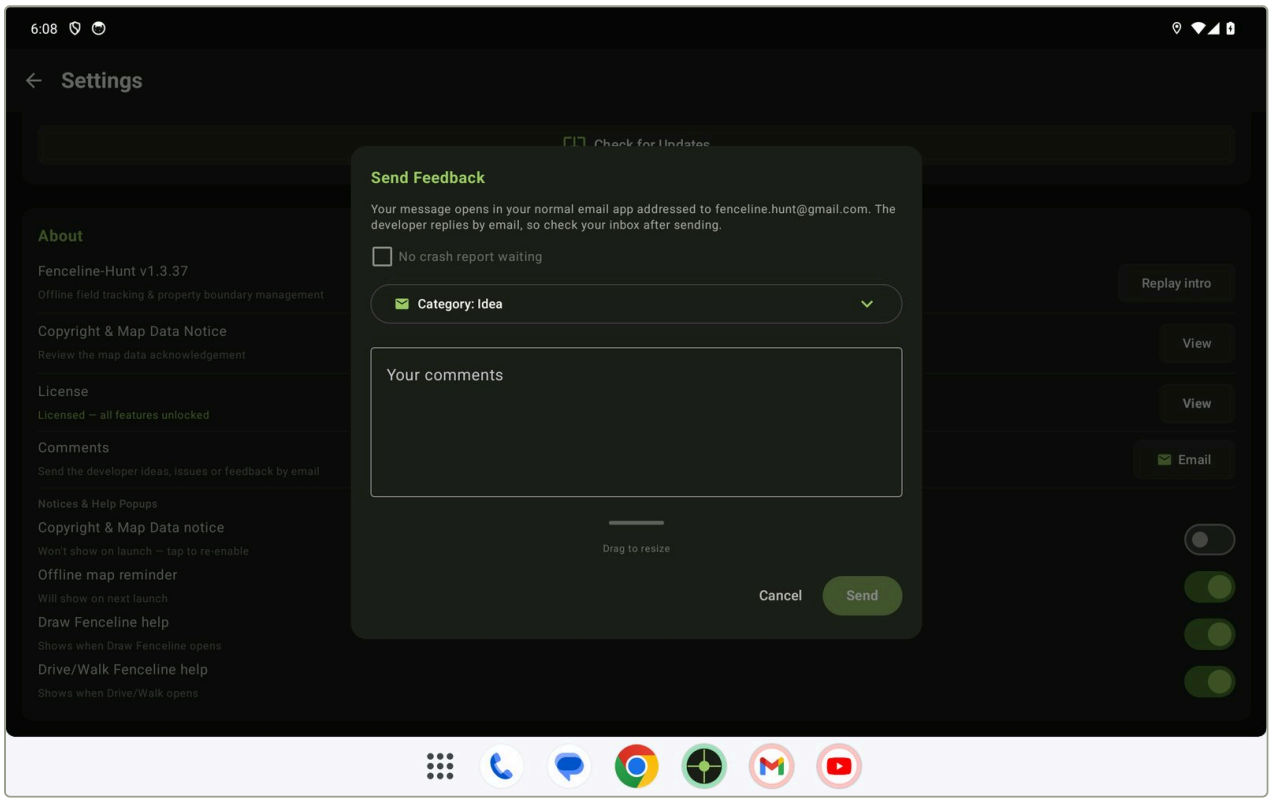

The main settings

Setting	What it does
Speed Units	km/h, mph, or knots — used by the HUD.
Altitude Units	Meters or feet for the altitude panel.
Default Map Layer	Standard, Terrain, Satellite or Hybrid — what the map opens with. A fresh install now opens on **Satellite**; the setting remembers whichever you pick.
Proximity Alert	Warns when you come within a set distance of a property boundary while recording.
Stationary Marker	Drops a "Stationary Point" pin automatically when you hold still for the set time while recording. The threshold slider steps in **15-second** intervals from 30 s to 5 min and spells the wait out in minutes and seconds — **"2 min 30 s"**, not "150s".
Cull Species	Opens the **Cull Species Sub-Types** page. Three modes sit in the top bar: **View** lists every species and sub-type exactly as the drop-pin cull menu offers them; **Edit** (pencil) adds custom sub-types with **+ Add** and removes user-added ones with the X — built-in sub-types are permanent; **Delete** (bin) removes a species you never cull from the drop-pin menu after a confirmation. Nothing is destroyed: deleted species move to a **Deleted Species** list on the same page and return with one tap on **Restore**, custom sub-types kept. The drop-pin menu updates immediately, and a hidden species stays selectable if you edit an old pin that already uses it. The **Information** button beside each animal explains licensing and permit requirements in a tabbed pop-up — **Licensing & Permits**, **Permit Types** and **Calibre & Setup** are a tab apart instead of one long page.
Notices & Help Popups	Re-enable anything you dismissed with "Don't show again" — the copyright and offline notices, and the Draw / Drive-Walk Fenceline how-to popups.

About	Re-read a notice any time with its **View** button: **Copyright & Map Data Notice**, **Offline Map Reminder** (the same "Going somewhere with no reception?" reminder shown on launch), and **License** (View once licensed, otherwise **Activate**). **Replay intro** plays the opening animation again.
Software Update	Check for a newer app version and install it in-app — download with a progress readout, an integrity check, then the standard Android install. See Chapter 2.

Comments — feedback to the developer

Settings ▸ **Comments** opens a feedback sheet that sends email straight to the developer, with a category so ideas, issues and questions sort themselves. If the app recorded a crash report from a previous run, an **"Include the crash report"** checkbox appears so the diagnosis arrives with the first email; when no report is waiting the row reads "No crash report waiting".

Send Feedback. Pick a category, write the message, and optionally attach the crash report. The reply comes back as a normal email.

CHAPTER 21

How your data is stored

Everything stays on the device — with automatic backups to protect it.

- **Local only.** Trips, properties, culls and settings live in a database on the device. Nothing syncs anywhere, nothing is uploaded.
- **Daily backups.** The app keeps automatic backups of the database so a bad update or a full disk cannot cost your history.
- **Integrity gate.** On launch the database is checked; if it has been damaged the app repairs it from the backups before anything else happens.

> **"Data Restored"** means the app found a damaged database and recovered your data from the most recent good backup — read the dialog, it lists what was restored. **"Data Reset"** is the last resort when no usable backup exists; the app rebuilds empty and you start fresh. This is rare, and the warning always gives you the choice before proceeding.

Uninstalling removes the data. If you are moving to a new device, use Import/Export (Ch. 19) first — an uninstall wipes the local database including its backups.

Part F — Help

Troubleshooting the common problems, answers to frequent questions, and the words this guide uses.

CHAPTER 22

Troubleshooting

No GPS fix

- Step outside — GPS needs sky view; metal roofs and dense canopy delay the first fix.
- Check location permission is **While using the app** (Ch. 3).
- Give it a minute — a cold GPS can take 60–90 seconds the first time each day.
- A rough position is better than none: when no GPS fix is available the app falls back to Wi-Fi and mobile-tower positioning, so the dot still appears and the map still moves to you — with a wide accuracy circle showing how rough it is.

> **The map finds you without a GPS fix.** On a device or a day where GPS cannot get a fix, the app no longer sits still with no position at all: it uses Wi-Fi and mobile-tower position so the dot appears and the map moves to you. The accuracy circle shows how much to trust it, the fallback steps aside the moment a real GPS fix arrives, and anything more than 2 km out is still ignored. Use the recenter button (Ch. 6) to come back to yourself at any time — if there is no position yet, it now says so instead of doing nothing.

Recording refuses to start

- The permission dialog appears but recording still refuses — open Android Settings ▸ Apps ▸ Fenceline-Hunt ▸ Permissions and set Location to "While using the app" there.
- The trial is used up — activate your licence (Ch. 4). The startup prompt explains how many trips remain.

The tracking notification disappeared

- The app was swiped away or closed — the recording was saved and stopped at that moment (Ch. 13). Reopen the app; the trip is in Trip History.
- If Android killed it in the background, set the app to **Not optimised** in battery settings (Ch. 3).

Drive/Walk Fenceline problems

- The record button isn't showing — tap the map once; it reveals itself for a few seconds (Ch. 18A).
- Stop did nothing — a track needs at least two points. Drive a little farther and stop again; the message on screen says when the track is too short.
- The converted boundary looks wrong at a corner — choose **Edit Map Now** and drag the pins; the simplification keeps corners but a very sharp turn at speed may need a nudge.
- The track jumped in a straight line across the map — that's a GPS dropout re-acquiring. The gap is bridged with a single pin; fix it with Edit Map Now if the shape matters.

Draw Fenceline problems

- Nothing happens when I tap the map — drawing is armed only by **+Add**. Tap **+Add** first (Ch. 18B).
- I deleted a pin by mistake — press **Undo**; it restores the last change, including a deleted pin.
- The Save button is greyed out — a boundary needs at least three pins and the ring closed by tapping the first pin.

Activation problems

- Type the key exactly as issued — no extra spaces, correct email.

- Connect to the internet once for the first validation, then it works offline again.
- Still failing? Settings ▸ Comments reaches the developer by email — include the licence email address you used.

CHAPTER 23

Frequently asked questions

Does my data leave the device?
No. Trips, properties, culls, photos and settings are stored locally (Ch. 21). The only network use is checking the licence, checking for app updates, and downloading public-land or offline map data you ask for.

What are the trial limits?
The trial allows a small number of recorded trips before activation. The startup prompt counts them down. Trips you already recorded stay in Trip History.

What is a licence key and why does it have an email?
Keys are issued to a specific email address — the pair is your proof of purchase and is checked together. Buy once, use it on your own devices.

Do the maps still work with no reception?
Yes, for any map saved as an offline basemap (Ch. 8). Save it before you go; the public-land and Google road layers need signal.

Why does the record button disappear sometimes?
It is touch-revealed — tap the map once and it appears (Ch. 11). This keeps the map clear while you pan. The Drive/Walk screen works the same way (Ch. 18A).

Can I record a boundary instead of drawing it pin by pin?
Yes — Drive/Walk Fenceline (Ch. 18A). Drive or walk the fence and the GPS track is converted into editable pins when you stop.

Can I record in portrait on a phone?
Fenceline-Hunt runs phones in landscape only — the map-first interface needs the width. Tablets rotate freely.

How do I update the app?
From inside the app: Settings ▸ Software Update ▸ Check for Updates, or tap the update banner at launch (Ch. 2). The download is integrity-checked before Install is offered, and updating keeps all your data.

I deleted a species from the cull menu — can I get it back?
Yes. Settings ▸ Cull Species lists everything removed under **Deleted Species**; tap **Restore** and it is back in the drop-pin menu (Ch. 20).

CHAPTER 24

Glossary

Word	Meaning in this guide
Basemap	Saved map imagery that works with no phone signal (Ch. 8).
Boundary	A drawn property outline that trips are recorded against (Ch. 10, 18).
Cull	An animal removed as part of pest or game management, logged from a drop pin (Ch. 9, 16).
Drop pin	A marked point on the map — a gate, damage, a cull — attached to the running trip (Ch. 9).

Free Roam	A trip recorded with no boundary attached (Ch. 10).
Fenceline	A saved boundary map for a property, drawn or imported (Ch. 18).
Drive/Walk Fenceline	Recording a boundary by driving or walking it — the GPS track becomes the boundary pins (Ch. 18A).
HUD	Heads-up display — the speed / altitude / heading panels along the bottom of the map (Ch. 7).
Trip	One recorded journey: the GPS track, its pins, distance and time (Ch. 12, 14).
